GOVERNMENT OF KERALA

**REPORT ON CROP CUTTING SURVEY ON AUTUMN,
WINTER AND SUMMER CROPS OF PADDY
1990-91**

**DEPARTMENT OF ECONOMICS AND STATISTICS
THIRUVANANTHAPURAM.**

P R E F A C E

The Department of Economics and Statistics is conducting crop estimation surveys on paddy since 1950, for each of the three crop seasons viz. Autumn (Virippu), Winter (Mundakan) and Summer (Punja). This report deals with the objects, area covered by in survey, the sampling techniques adopted, the results of the analysis of data and the reliability of the results obtained from the crop estimation surveys in respect of Autumn, Winter and Summer seasons of paddy crop during 1990-91.

This report was prepared in the Agricultural Statistics Division of the Department of Economics and Statistics.

Suggestions for the improvement of the report are welcome.

Dr.M.Kuttappan

REPORT ON CROP CUTTING SURVEY OF AUTUMN, WINTER AND SUMMER CROPS OF PADDY - 1990-91

1. Introduction:

The Department of Economics and Statistics has been regularly conducting crop cutting surveys on paddy for the three crop seasons of Autumn (Virippu) Winter (Mundakom) and Summer (Punja) every year in the state. This report relates to the survey conducted for Autumn, Winter and Summer seasons of 1990-91.

2. Objectives of the survey

The main objectives of the yield estimation survey on paddy are:-

- i. To estimate the mean yield per hectare of dry paddy, at Block, District and State level for each season.
- ii. To estimate production of rice at Block, District and State level.
- iii. To estimate mean yield and productivity of high yielding varieties of paddy at District and State level.
- iv. To study the impact of various cultivation practices on the productivity of paddy crop.

3. Period of the survey

The period of the field work for Autumn season was from July 1990 to October 1990. Winter season was from November '90 to February 1991 and that for Summer season was March 1991 to June 1991.

4. Coverage

The survey was designed to cover the whole state except the forest area.

5. Sampling design

The survey was conducted based on a stratified multistage sampling design. Under the present system blocks are considered as strata and investigator zones in each block forming sub-strata and first stage unit. Paddy growing survey sub-divisions in the selected cluster form the second stage units.

In each zone, separate lists of survey sub-divisions of wet land plots growing paddy under HYV irrigated, HYV unirrigated, local-irrigated and local-unirrigated are prepared. The required number of plots are selected by using circular systematic sampling method from the above lists. One Kandom each is chosen by simple random method, after serially numbering the Kandoms in the selected Sy sub-divisions in anti-clockwise direction starting from the south-west corner. They form the third stage unit. A square plot of 5 metres located in the selected Kandom forms the ultimate sample unit and the crop in the demarcated plot is harvested, threshed, winnowed and weighted. The weight of the cleaned grains and other relevant details such as irrigation status use of manures, fertilizers, insecticides, pesticides etc. are recorded in the prescribed schedule. In each investigator zone Six experiments are conducted in each season. In each Corporation and Municipality the number of experiments per zone per season is limited to 10 and 6 respectively.

Blocks in rural areas and Municipalities and Corporation in urban areas in each district are treated as stratum. The Blocks are again divided in to a number of investigator zones depending on the area of the block, nature of land etc. Corporation area is divided into 3 investigator zones and municipalities with an area of 10 sq.K.m and more, are treated as one investigator zone. These investigator zones formed for the Establishment of an Agency for Reporting Agricultural Statistics (EARAS) survey are treated as sub-stratum for this survey. The remaining small municipalities are merged with the adjoining blocks.

In each investigator zone, 100 clusters of 5 survey sub-divisions are selected for the survey. These 100 clusters are allocated among the wet and dry lands in proportion to the area under these categories in the zone.

For selecting the clusters in the investigator zones, list of wet land survey sub divisions and dry land survey sub divisions as per the basic tax register are prepared separately in an orderly manner (one village after the other). The required number of key plots (survey sub-divisions) are selected, from each list in proportion to the wet and dry land area, for forming the clusters using circular systematic sampling method. These key plots together with the two other adjacent plots on either side (left and right in the horizontal direction) from the cluster. The wet land cluster of five survey sub-divisions each are visited in each paddy growing season in the investigator zone for the collection of details of area under paddy during the season from these paddy growing plots 6 survey sub divisions are selected for the conduct of crop cutting survey in each investigator zone in every paddy season.

From every Block, three samples each weighing 250 gms of wet paddy are collected at the time of harvest for conducting driage experiments. The first sample is taken at the beginning, the second towards the middle and the third towards the end of the harvest season. These samples are dried and weighed until weights on two consecutive days agree. The driage ratio thus obtained was utilised for the estimation of dry weight of paddy.

6. Field work

The field work of the survey was attended to by the investigators under the immediate supervision of Taluk Statistical Inspectors and Taluk Statistical Officers. The Deputy Director of the districts were in over all charge for the proper conduct of the survey. He was assisted by the District Officers and Additional District Officers.

During the crop seasons of Autumn, Winter and Summer 1990-91 the total number of crop cutting experiments planned were 4816, 4470, and 2792 respectively.

The number of crop cutting experiments analysed during Autumn, Winter and Summer were 4152 (86%), 4395(98%) and 2769 (99%). The number of experiments planned and analysed in each block during Autumn, Winter and Summer 1990-91 are furnished in table 1.1, 1.2 and 1.3 respectively.

7. Supervision

The yield estimation survey was inspected at pre-harvest, harvest and post harvest stages by the Taluk level and District level Officers. The Statistical Inspectors and Taluk Statistical Officers were made responsible to inspect atleast one experiment in each investigator zone and the Deputy Director, District Officer and Additional District Officer were to inspect

atleast one experiment in each block at the harvest stage. The Taluk Statistical Officer/Statistical Inspector had to conduct at least one harvest stage inspection in each investigator zone subject to a minimum of 5 experiments in a block. Over and above, the Officers of the Agriculture Department had to conduct supervision on 1% of the crop cutting experiments in the districts.

The percentage of experiments inspected during the Autumn, Winter and Summer seasons 1990-91 are given in the following table.

Season	No.of Crop cutting experiments conducted	Percentage of experiments inspected			Total
		Pre- harvest stage	Harvest stage	Post harvest stage	
1		3	4	5	6
Autumn 90-91	4152	6.94	19.97	0.55	27.46
Winter "	4395	6.71	16.95	0.59	24.25
Summer "	2769	6.50	20.34	1.05	27.89

8. Analysis of data

On completion of the field work of the survey the data collected in each season were transmitted to the concerned district officer of the department and consolidated data from each district were forwarded to the Head Office by the Deputy Directors of the Districts. Tabulation and analysis of data so collected were done by the Agricultural Statistics Division of the Directorate. The procedure adopted for estimation of various parameters at Block, District and State level is described in the consuming paragraphs.

9. Estimation

Mean yield of paddy, its standard error and production of rice were estimated from the data collected through the surveys. Estimation of mean-yield has been done separately for the following categories of paddy and weighted average was computed to obtain the meanyield of all varieties together.

1. Paddy high yielding Varieties - Irrigated (HYV-1)
2. Paddy high yielding varieties - unirrigated (HYV-UI)
3. Paddy local varieties - Irrigated (L - I)
4. Paddy local varieties - Unirrigated (L - UI)

(i) Mean yield of paddy at block level

The following formula has been utilised to estimate meanyield of paddy at block level.

$$\bar{x}_p = \frac{\sum_{j=1}^p x_{pj} \times 400 \times d}{np}$$

Where,

np = Number of crop cutting experiments conducted on the pth category paddy in the block.

x_{Py} = weight of paddy (in Kg.) obtained from the j th experiment on the p th category paddy of the block.

$P = 1, 2, 3, 4$ - represents HYV - I, HYV-UI L-I and L-UT respectively.

d = The weight of dry paddy per Kg. of the harvested produce obtained through drage experiments.

The experimental plot is $1/400$ th of a hectare and hence x_p gives the mean yield of dry paddy per hectare of the p th category at Block level.

Mean yield of dry paddy of the block for all categories taken together is obtained by computing the weighted average of the yield of all the four categories, weights being the proportion of area under paddy of the respective classifications. Thus mean yield of dry paddy (all categories together) in Kg. per hectare of the block is given by:-

$$X = \frac{ap_p}{\frac{p=1}{4} ap}$$

Where,

ap is the area under the p th category paddy in the block.

Mean yield of paddy for the district is obtained as the weighted average of the mean yield of the blocks in the district, weight being the proportion of area under the crop in the respective blocks. So also mean yield of paddy for the state is computed as the weighted average mean yield of the district, weights being the proportion of area under the crop in the respective districts.

(ii) Standard error of block mean yield:-

Standard error of mean yield per hectare of the p th category paddy of the block is computed using the formula:-

$$Sp = \frac{M.S.S}{np} \times 400 \times d$$

Where, np = Number of crop cutting experiments conducted on the p th category paddy of the block.

$$M.S.S = \frac{T.S.S}{np - 1}$$

$$T.S.S = \frac{\sum_{j=1}^{np} x_{pj}^2 - (\bar{x} \times p_j)^2}{np}$$

Where X_{pj} is the weight of the harvested produce obtained from the j th cut on the p th category paddy of the block.

Contd.....

This standard error of the block meanyield is given by:-

$$S = \frac{\sqrt{\frac{4}{P-1} \sum_{p=1}^P (ap - Sp)^2}}{\sqrt{\frac{4}{P-1} \sum_{p=1}^P ap^2}}$$

Where ap represents the area of p th category in the block.

The standard error of the district meanyield is obtained by:-

$$S = \frac{\sqrt{\frac{1}{n-1} \sum_{i=1}^n (ai - Si)^2}}{\sqrt{\frac{1}{n-1} \sum_{i=1}^n ai^2}}$$

Where

n = number of blocks in the district.

ai = area under paddy in the i th block of the district.

Si = Standard error of meanyield in the i th block.

Computation of the standard error of the state meanyield is also made utilising the same formula. Where ' n ' will represent the number of districts in the state, ' ai ' area under paddy in the i th district and Si the standard error of meanyield of the district.

(iii) Production of rice

The estimates of meanyield obtained from area enumeration under the Survey "Establishment of an Agency for Reporting Agricultural Statistics" (EARAS) were utilised for computation of estimates of production of rice. In terms of weight 65.7% clean rice is accounted for from dry paddy.

10. Result of the Survey

(i) General:-

The total production of rice in the state during 90-91 has been estimated as 1086578 tonnes which is less than the previous years production of 1141231 tonnes. The decrease in production during this year compared to the previous year is 54653 tonnes which is about 4.8%.

State level estimates of area meanyield of dry paddy and production of rice during 90-91 and the season-wise percentage variation over the previous year are shown below.

Crop	Area under Paddy (Hect)		% Variation	Mean yield of dry paddy in Kg/Hect		% Variation	Production of rice in tonnes		% Variation	
	1989-90	1990-91		1989-90	1990-91		1989-90	1990-91		
Season	1	2	3	4	5	6	7	8	9	10
Autumn	243611	236078	-3.09	2991	2985	-0.20	478643	463025	-3.26	
Winter	268599	258564	-3.74	2857	2829	-0.98	504157	480655	-4.67	
Summer	71179	64808	-8.95	3387	3356	-0.92	158391	142898	-9.78	

During the crop season of Autumn 90-91 in area mean yield and production decreased by -3.09%, -0.20% and -3.26% respectively compared to the corresponding season of the previous year. The above trend continued during the winter season also and the area meanyield and production decreased by -3.74% -0.98% -4.67% respectively compared to the corresponding season of the previous year. Similarly the summer season was not an exception to the trend in the previous two seasons and the area, meanyield and production decreased by -8.95%, -0.92% and -9.78% respectively.

The scheme for block-wise estimation of meanyield and production was implemented from 1987-88 onwards. Considering taluk as the stratum was changed and block-wise considered as the stratum for forming block level estimates from crop season khariff 1987-88 onwards.

The details of crop cutting experiments conducted during the last three years are shown below:-

Year	No. of Crop Cutting experiments conducted		
	Autumn	Winter	Summer
1	2	3	4
1988-89	4271	4477	2815
1989-90	4233	4428	2821
1990-91	4152	4395	2769

Analysis of 4152 crop cutting experiments conducted on Autumn paddy 4395 experiments on winter paddy and 2769 experiments on summer paddy revealed that 35% of the crop cutting experiments during Autumn 38% of the crop cutting experiments during winter and 34% of the crop cutting experiments during summer had reported yield rate between 2001-3000 Kg/ha while 24% of the experiments in Autumn 28% of the experiments in winter and 18% in summer recorded an average yield of 3001 to 4000 Kg/ha. But 21% of experiments in Autumn, 16% of experiments in winter and 25% of the experiments in summer recorded an average yield rate of 1001 to 2000 Kg/hg only 7% of the total experiments conducted in Autumn 4% of the experiments in winter and 6% of the experiments in summer had an average yield rate below 1000 Kg/ha only.

Sl. No.	Yield range (Kg/ha)	Percentage of Experimental plots		
		Autumn	Winter	Summer
1	2	3	4	5
1.	0 - 1000	0.48	0.15	1.16
2.	1001-2000	6.59	4.22	5.99
3.	2001-3000	21.07	16.26	25.37
4.	3001-4000	34.52	37.58	33.93
5.	4001-5000	24.35	27.57	18.39
6.	5001-6000	9.98	9.38	9.38
7.	6001 and above	2.27	3.49	4.81
8.		0.74	1.38	0.97
Total		100.00	100.00	100.00

The estimates of area, mean yield standard error and production of rice at block level for Autumn, Winter and Summer paddy 1990-91 are furnished in tables 1.1, 1.2 and 1.3 respectively along with the number of crop cutting experiments analysed. The estimates of mean yield of Autumn, Winter and Summer paddy for the three years from 1988 to 90 are furnished in tables 2.1, 2.2 and 2.3 respectively for a comparative study.

The district-wise area under paddy, mean yield and production of rice for Autumn, Winter, Summer 1990-91 are furnished in table 3.1, 3.2 and 3.3 respectively in respect of high yielding varieties and other varieties. Details for the state as a whole are furnished in the table given below:-

Area and Production of Autumn, Winter and Summer Paddy 1990-91 for the State

Variation of Paddy	Area under Paddy			Mean yield of dry Paddy (Kg/ha)			Production of rice (tonnes)		
	Autumn	Winter	Summer	Autumn	Winter	Summer	Autumn	Winter	Summer
1	2	3	4	5	6	7	8	9	10
High yield- ing varie- ties	80025	40005	42786	3170	3365	3710	166657	88436	104279
Other Varieties	156053	218559	22022	2891	2731	2669	296368	392219	38619
All Varieties	236078	258564	64808	2985	2829	3356	463025	480665	142898

The percentages area under high yielding varieties and local varieties of paddy during Autumn 91 were 34 and 66 respectively while the percentages share in production were 36% and 64% respectively. But in the case of winter paddy '91 the percentage of area under higher yielding varieties and other varieties 15 and 85 respectively and those of production were 18 and 82 respectively. In the case of summer paddy 1991 the percentage of area under high yielding and other varieties were 66 and 34 respectively and those of production were 59 and 41 respectively. The extent of area under and production of high yielding varieties have increased during the three seasons of Autumn, Winter and Summer 1990-91 compared to the previous year.

The number of crop cutting experiments conducted as high yielding varieties name of the variety having highest average yield and yield rate in respect of each districts for Autumn, Winter and Summer 90-91 are furnished in the following tables.

High Yielding Variety with highest meanyield Autumn 1990-91

Cultural Practices

a) **Autumn Paddy 1990-91:-** During Autumn season, out of 4152 experimental plots selected for crop cutting 348 plots (8%) were irrigated. Among these irrigated plots 85.28% of the plots were chemically manured and in 12.66% of the plots organic manures were applied. The rest of the 2.06% were not manured. Out of 3804 unirrigated plots 82.20% were applied with chemical fertilisers and 15.42% with other organic manures while 2.38% of the plots were not manured. It is observed that 99.5% of the plots cultivated in the high yielding varieties of paddy were chemically or organically manured during the Autumn season 1990-91.

Plant protection measures were taken in 40.46% of the experimental plots grown in the high yielding varieties and 32.38% of the plots grown with local varieties.

b) **Winter Paddy 1990-91:-** During Winter season out of 4395 experimental plots selected for crop cutting 2449 plots (56%) were irrigated. Among these irrigated plots 91% were chemically manured and in 6.8% plots organic manures were applied. The rest of the plots (2.20%) were not manured. Out of 1946 unirrigated plots 81.25% were applied with chemical fertilisers and 15.7% with other organic manures while 3.05% of the plots were not manured. It is observed that 98.8% of the plots cultivated with high yielding varieties of paddy were chemically or organically manured during winter season 1990-91.

Plant protection measures were taken in 79.5% of the experimental plots grown with high yielding varieties and 49% of the plots grown with local varieties.

c) **Summer Paddy 1990-91:-** Of the 2769 experimental plots were paddy crop cutting was conducted in summer season 2573 plots (93%) were irrigated and in 87.30% of the irrigated plots chemical fertilisers were applied while 10.70% of the irrigated plots were applied with other manures. In the remaining 2% of the irrigated plots no manuring was done. There were 196 experimental plots where irrigation was not provided. Of these 90% of the plots were applied with chemical fertilisers and 7.5% plots with other organic manures while 2.5% were not manured at all. 99% of the experimental plots cultivated with high yielding varieties were applied with chemical fertilisers or manures.

Plant protection measures such as treatment with insecticides pesticides etc. were adopted in 74% of the plots where paddy crop cutting experiments were conducted in Summer season. The treatment was done in 84.5% of the plots grown with high yielding varieties and the corresponding figures for other varieties was on 63%.

The District-wise details of mean yield and number of crop cutting experiments analysed in respect of Autumn Winter and Summer paddy 90-91 grown under various cultural practices are furnished in tables 4.1, 4.2 and 4.3 respectively.
