

GOVERNMENT OF KERALA

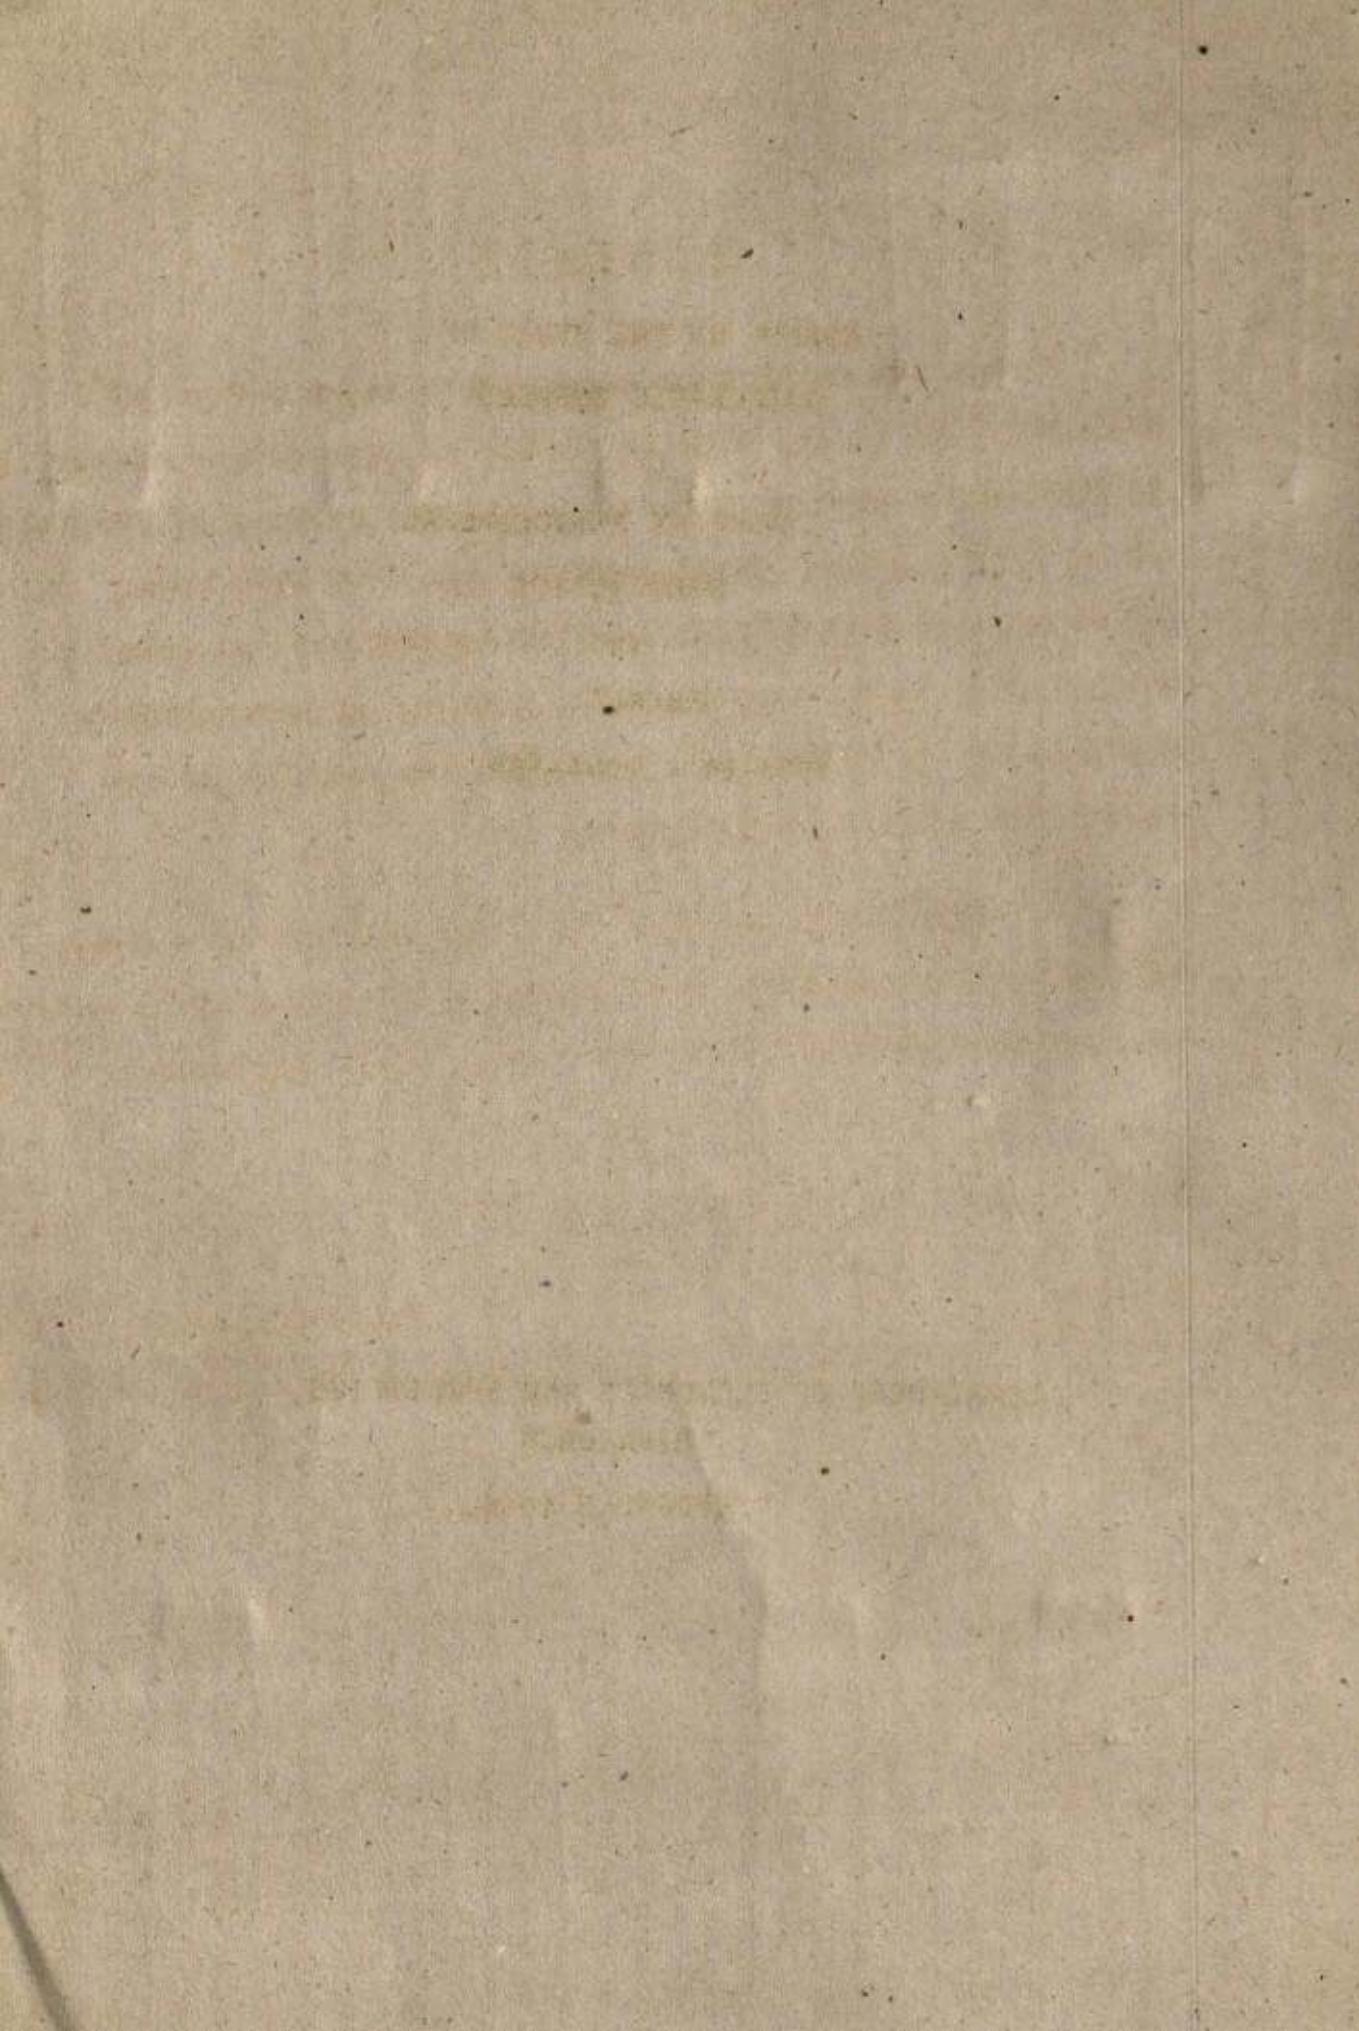

REPORT ON
THE
STUDY OF MARKETABLE SURPLUS OF
IMPORTANT
AGRICULTURAL COMMODITIES
IN KERALA
1983-84 & 1984-85

DEPARTMENT OF ECONOMICS & STATISTICS, TRIVANDRUM
SEPTEMBER 1986

REPORT ON THE STUDY OF
MARKETABLE SURPLUS
OF
IMPORTANT AGRICULTURAL
COMMODITIES
IN
KERALA
1983-84 & 1984-'85.

DEPARTMENT OF ECONOMICS AND STATISTICS,
TRIVANDRUM
SEPTEMBER 1986.

P R E F A C E

Though the department generates a large volume of data relating to the various fields of agriculture sector in the State, lack of information on the pattern of disposal of important agricultural produces was felt very much. In order to meet this requirement the department conducted two rounds of a survey on marketable surplus of agricultural commodities in 1983-84 and 1984-85. The results of the survey are given in this report.

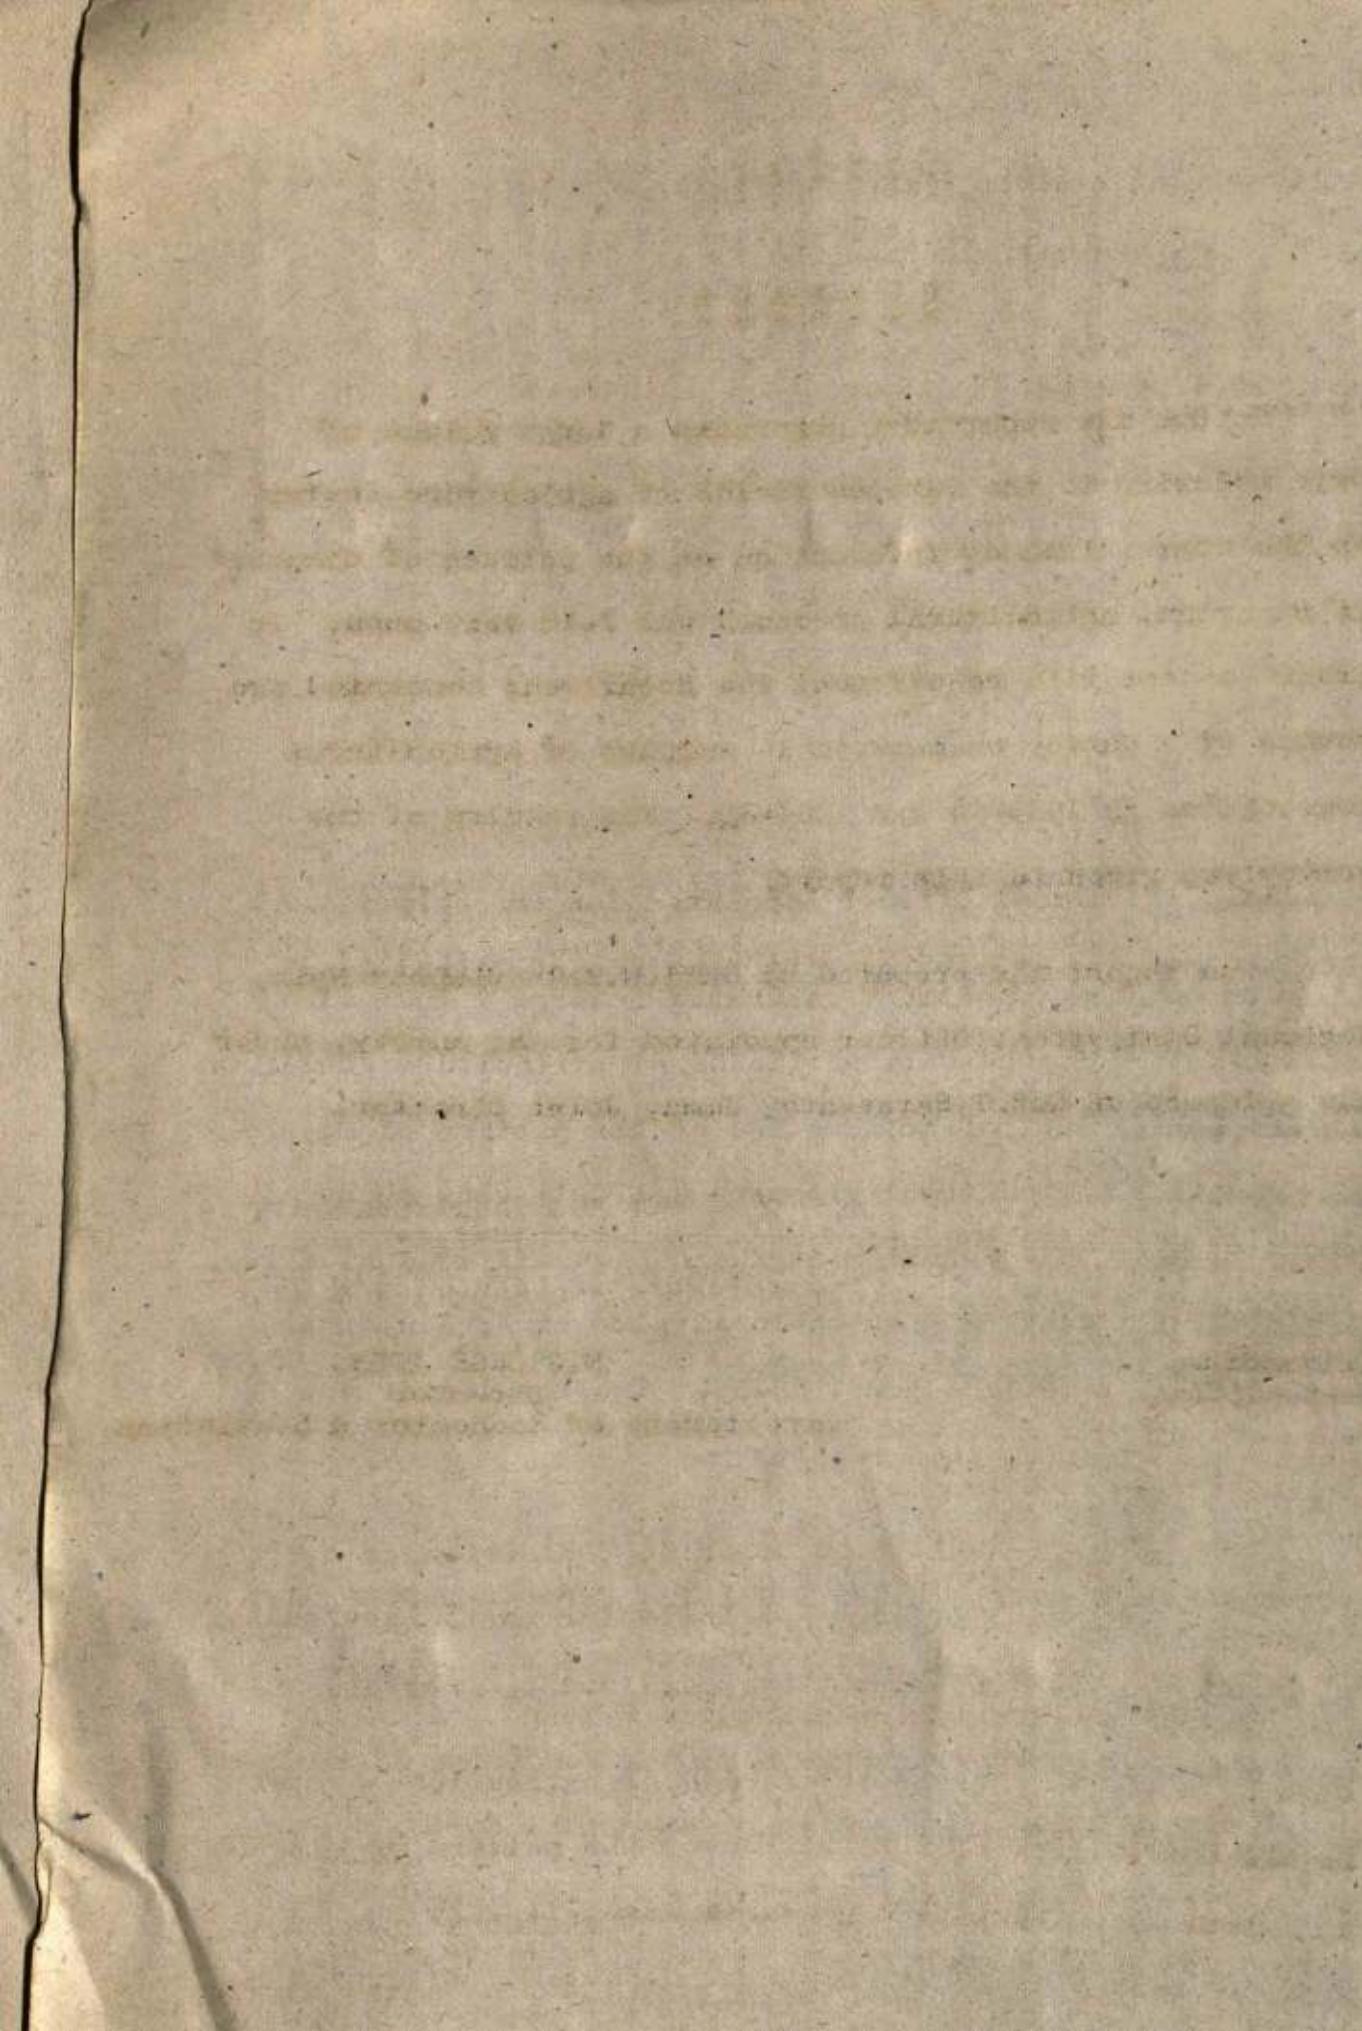

The report was prepared by Shri.N.Balakrishnan Nair, Regional Statistical Officer appointed for the survey, under the guidance of Smt.T.Saraswathy Amma, Joint Director.

Though the department generates a large volume of data relating to the various fields of agriculture sector in the State, lack of information on the pattern of disposal of important agricultural produces was felt very much. In Trivandrum, 3-9-1986. To meet this requirement the department conducted two rounds of a survey on marketable surplus of agricultural commodities in 1983-84 and 1984-85. The results of the survey are given in this report.

N.GEORGE JOHN

Report on the study of 'Marketable Surplus' of important agricultural commodities in the State

Introduction:

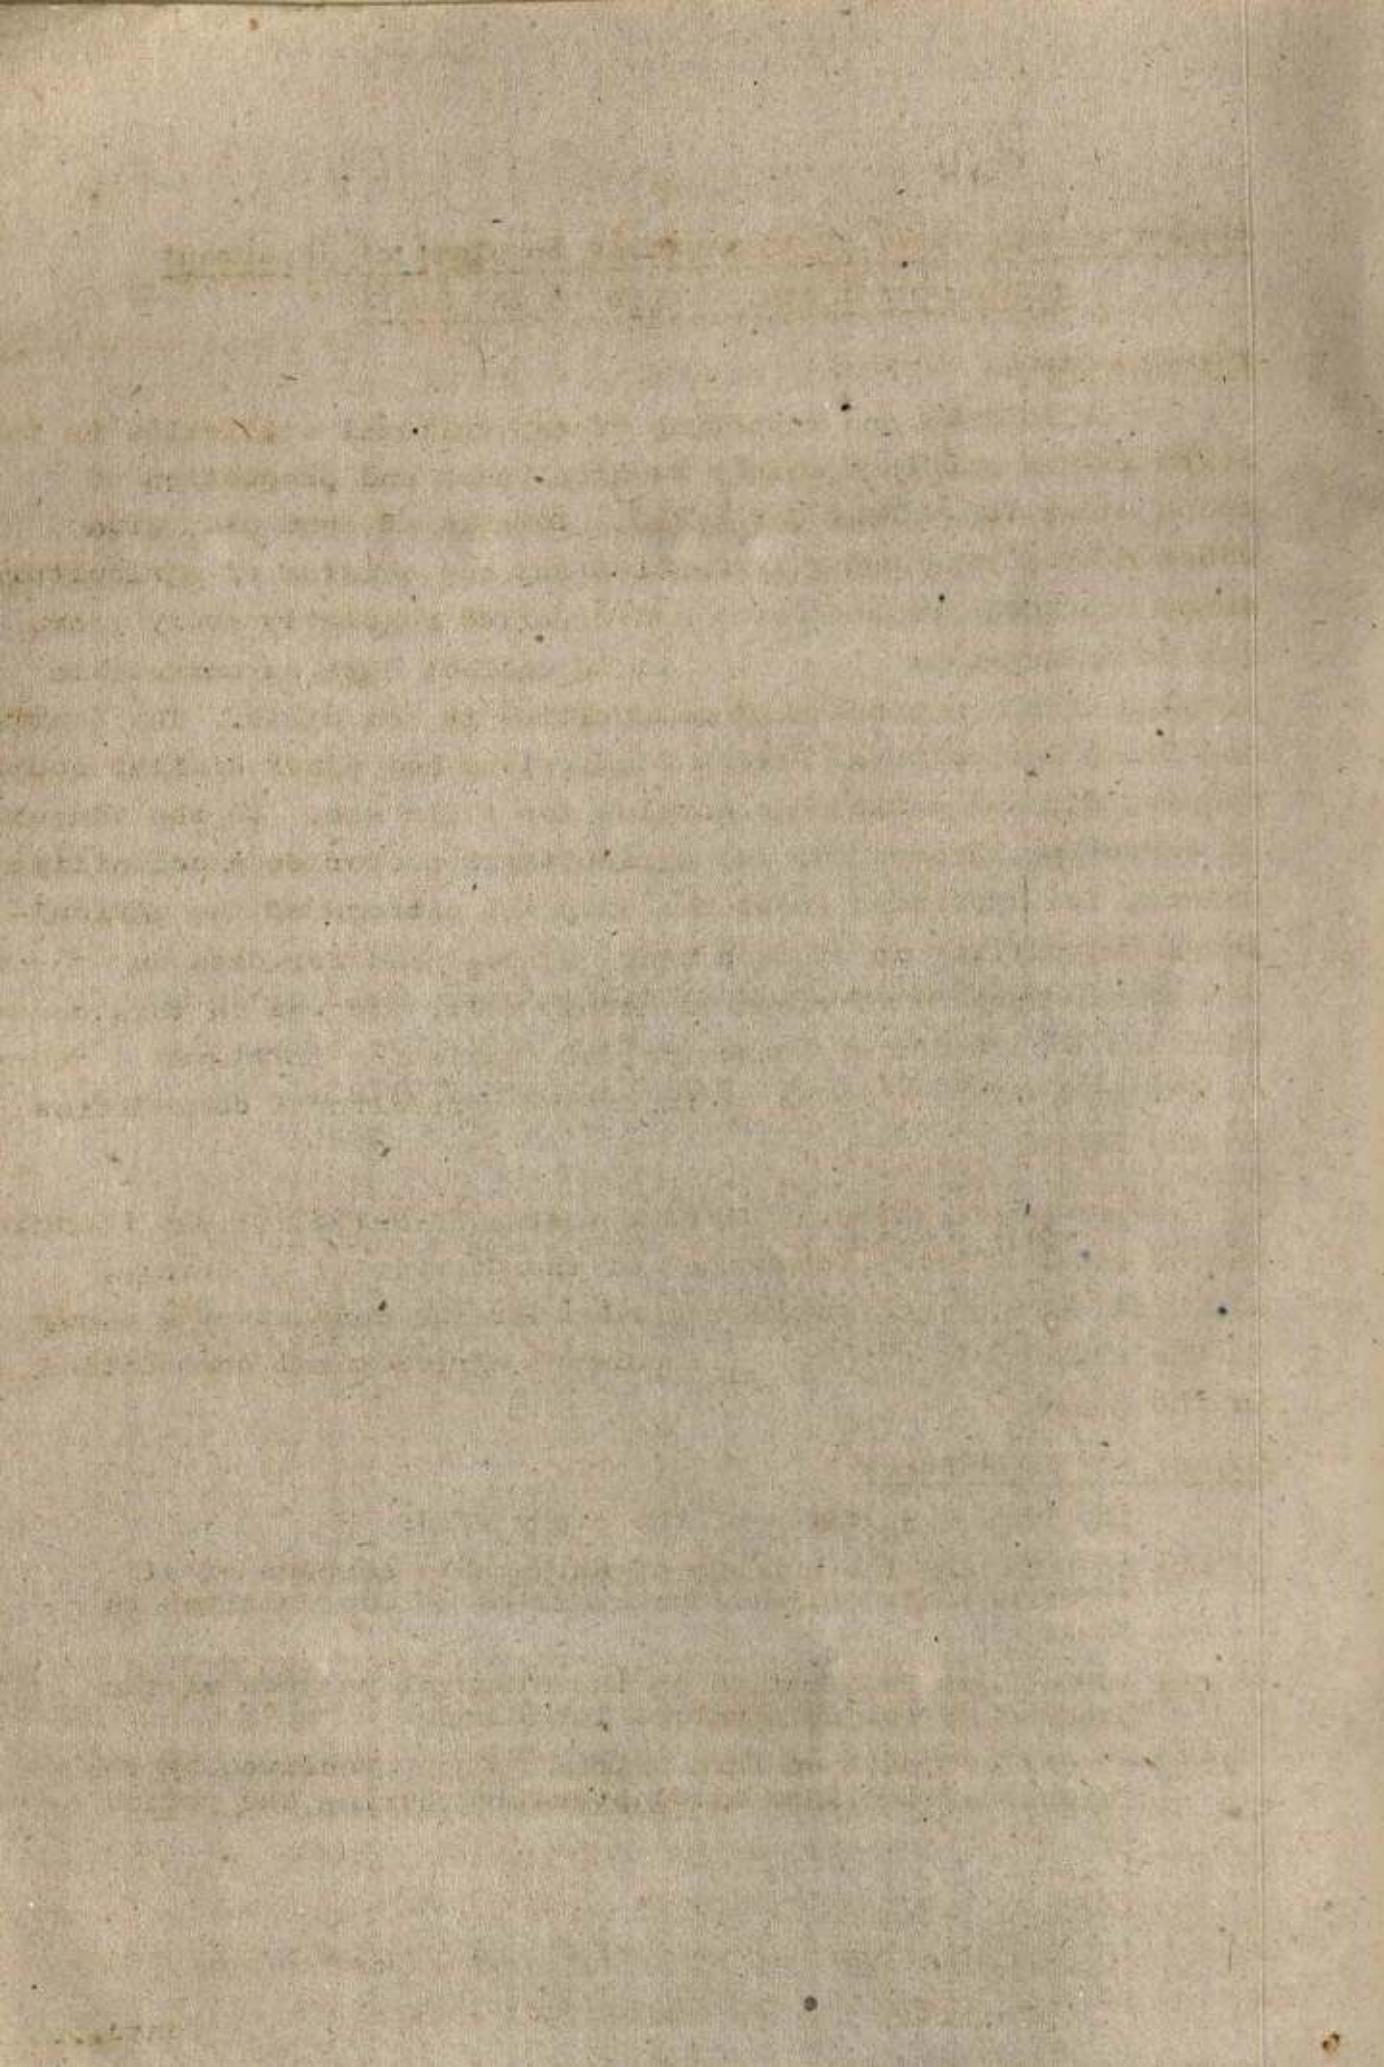

Collection and reporting of agricultural statistics in the State is now confined mainly to area under and production of crops under the scheme for SARAS. Details of land use, area under crops, area under irrigation and the quantum of agricultural crops produced are collected and reported regularly every year. But no arrangement was available to collect data on marketable surplus of the agricultural commodities in the State. The Central and State Agricultural Prices Commissions and other similar bodies require data on marketable surplus for their use. In the context of computing income from the agricultural sector on a scientific manner, the knowledge about the disposal pattern of the agricultural commodities is of much use. Hence, need for data on marketable surplus of crops is keenly felt. It was in this context that the Department of Economics and Statistics initiated a study on the marketable surplus of important agricultural commodities in the State.

As per G.O.(MS)No.55/82/Ptg. dated, 28-9-1982 of the Planning and Economic Affairs Department of the Government of Kerala, administrative sanction was accorded for the conduct of a study on the marketable surplus of important agricultural commodities in the State.

Object of the Survey:

The main objectives of the study were:

- i) to estimate the quantum of marketable surplus of all important agricultural commodities at the cultivators level;
- ii) to collect information on the disposal pattern of the produce at the cultivators level and
- iii) to collect data on farm prices (prices received by the farmers at the farm site) prevailed during the period of the survey.

Coverage:

The survey covered 53 Taluks of the State (except Kanjirappally, Peermade, Devicolam, Vythiri and Manantoddy taluks). The following important agricultural crops were covered in the study:

1. Paddy { Autumn
 Paddy Winter
 Paddy Summer}
2. Coconut
3. Tapioca
4. Arecanut
5. Pepper
6. Banana
7. Ginger

Design of the survey:

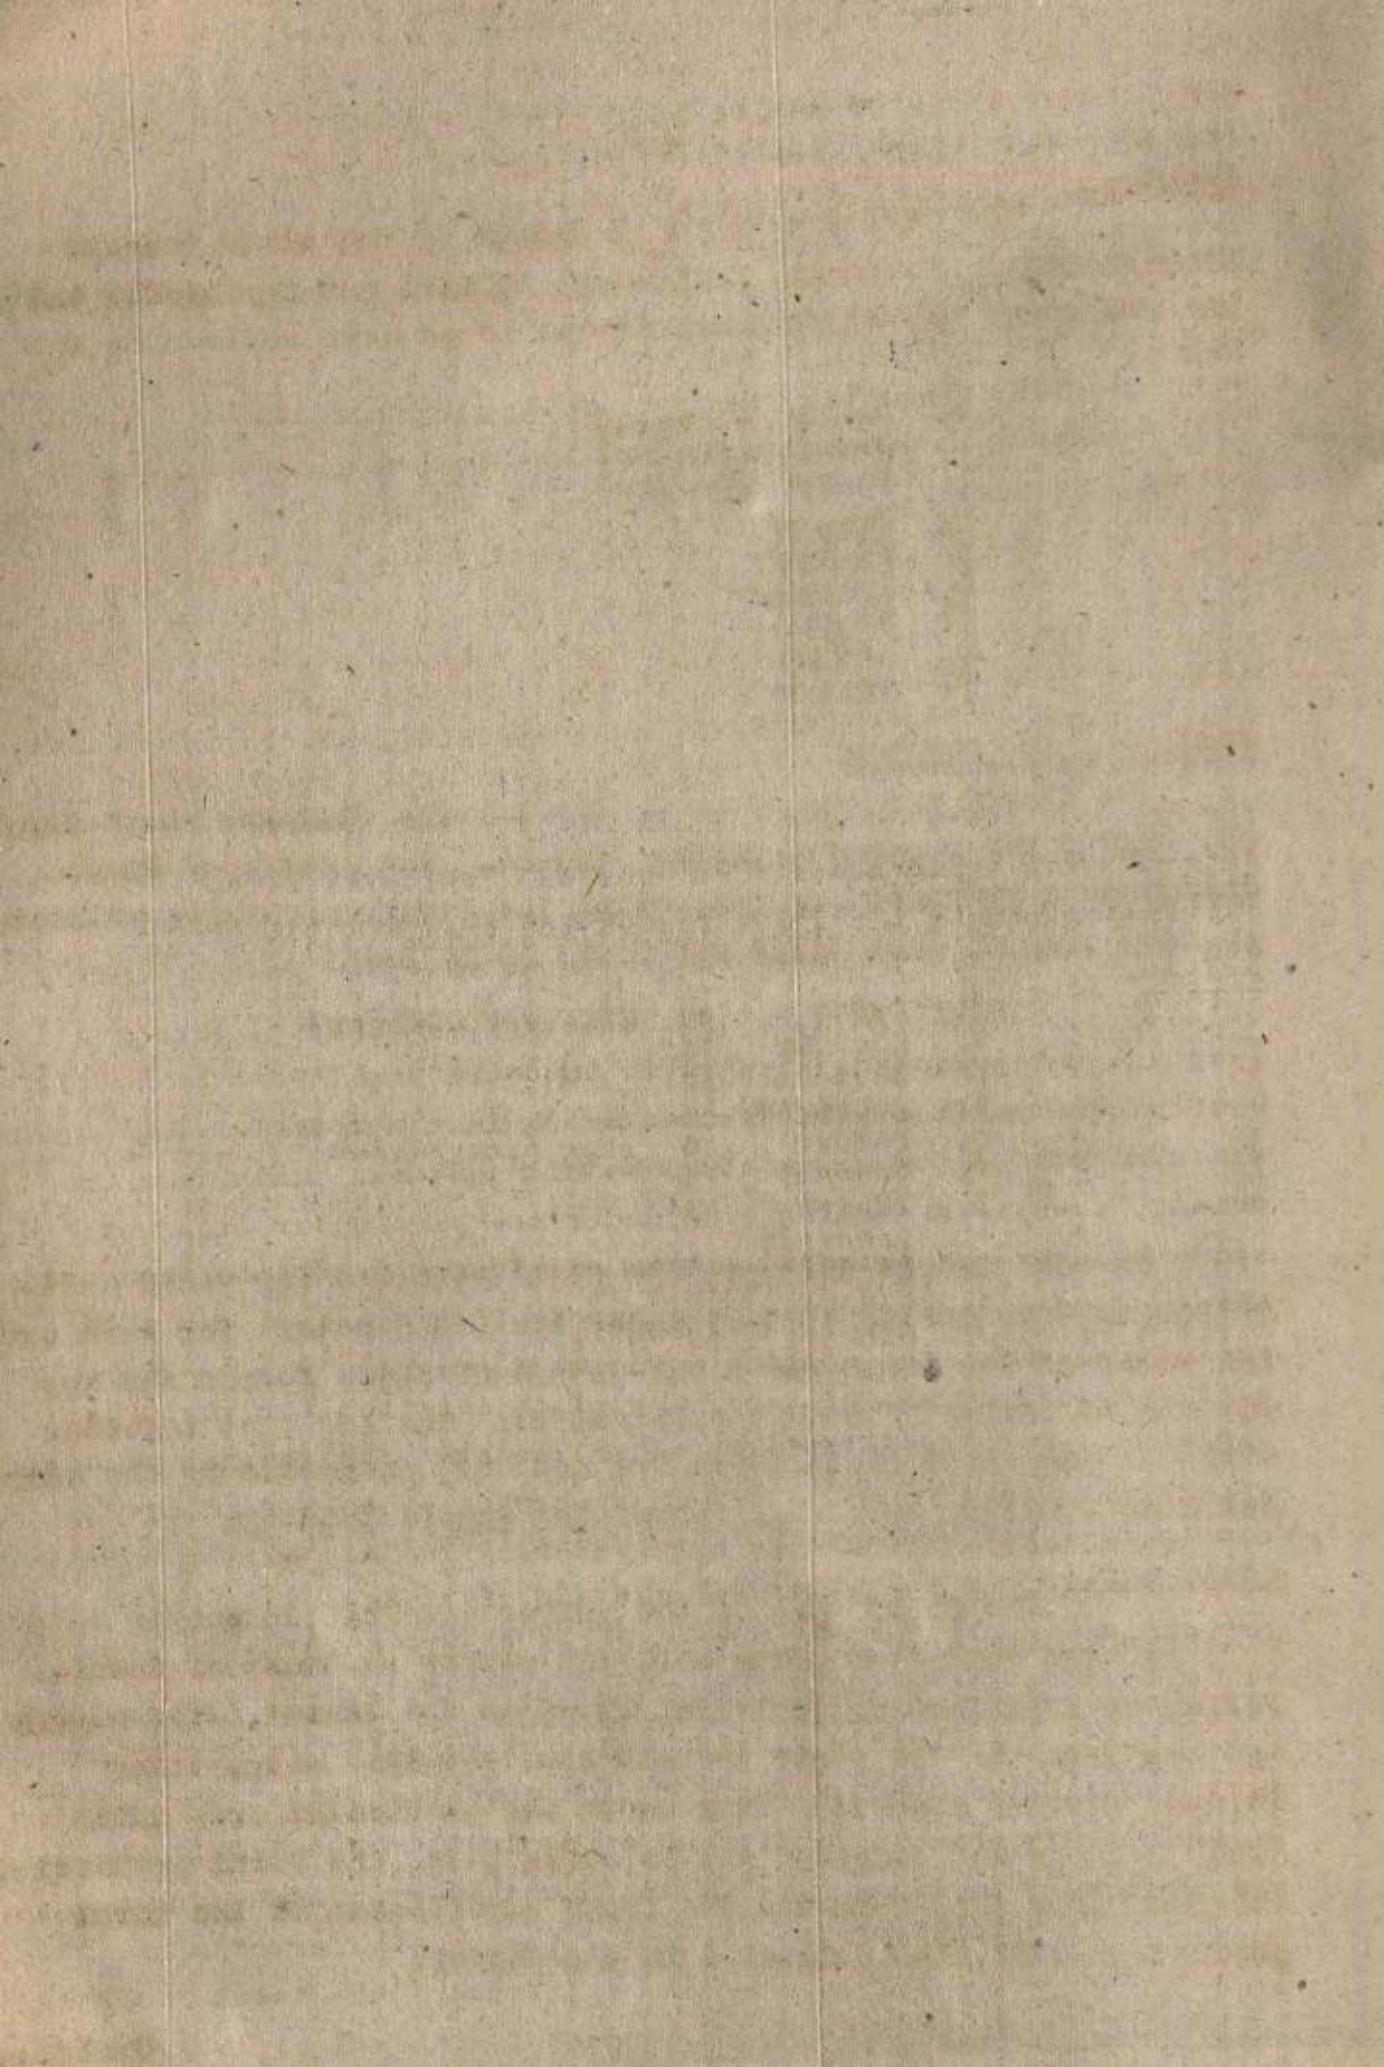

The survey was conducted in the Revenue Villages where land use survey was conducted during 1983-84. The number of sample cultivators selected for collecting the required details relating to each crop in each taluk was fixed as follows:

- | | | | |
|----|----------|----|-------------------|
| 1. | Paddy | 10 | (for each season) |
| 2. | Coconut | 10 | |
| 3. | Tapioca | 10 | |
| 4. | Arecanut | 5 | |
| 5. | Pepper | 5 | |
| 6. | Banana | 5 | |
| 7. | Ginger | 5 | |

In each sample village, the plots selected for yield estimation surveys during 1982-83 under the EARAS Scheme for each crop was taken as the frame and a sub sample of plots formed the key for the selection of sample cultivators. The key plot together with all the other plots (both wet and dry) possessed by the sample cultivator within the Taluk formed the sample holding.

Field work:

The field work of the survey was started during July 1983 and was conducted along with the survey on 'Cost of Cultivation of important agricultural crops in the State'. The survey was conducted in two years 1983-84 and 1984-85. Among other things, details regarding area under the particular crop under study held by the selected sample cultivator, the total production obtained from that area and the types of disposal of the total production were also collected in the survey.

Tabulation and analysis:

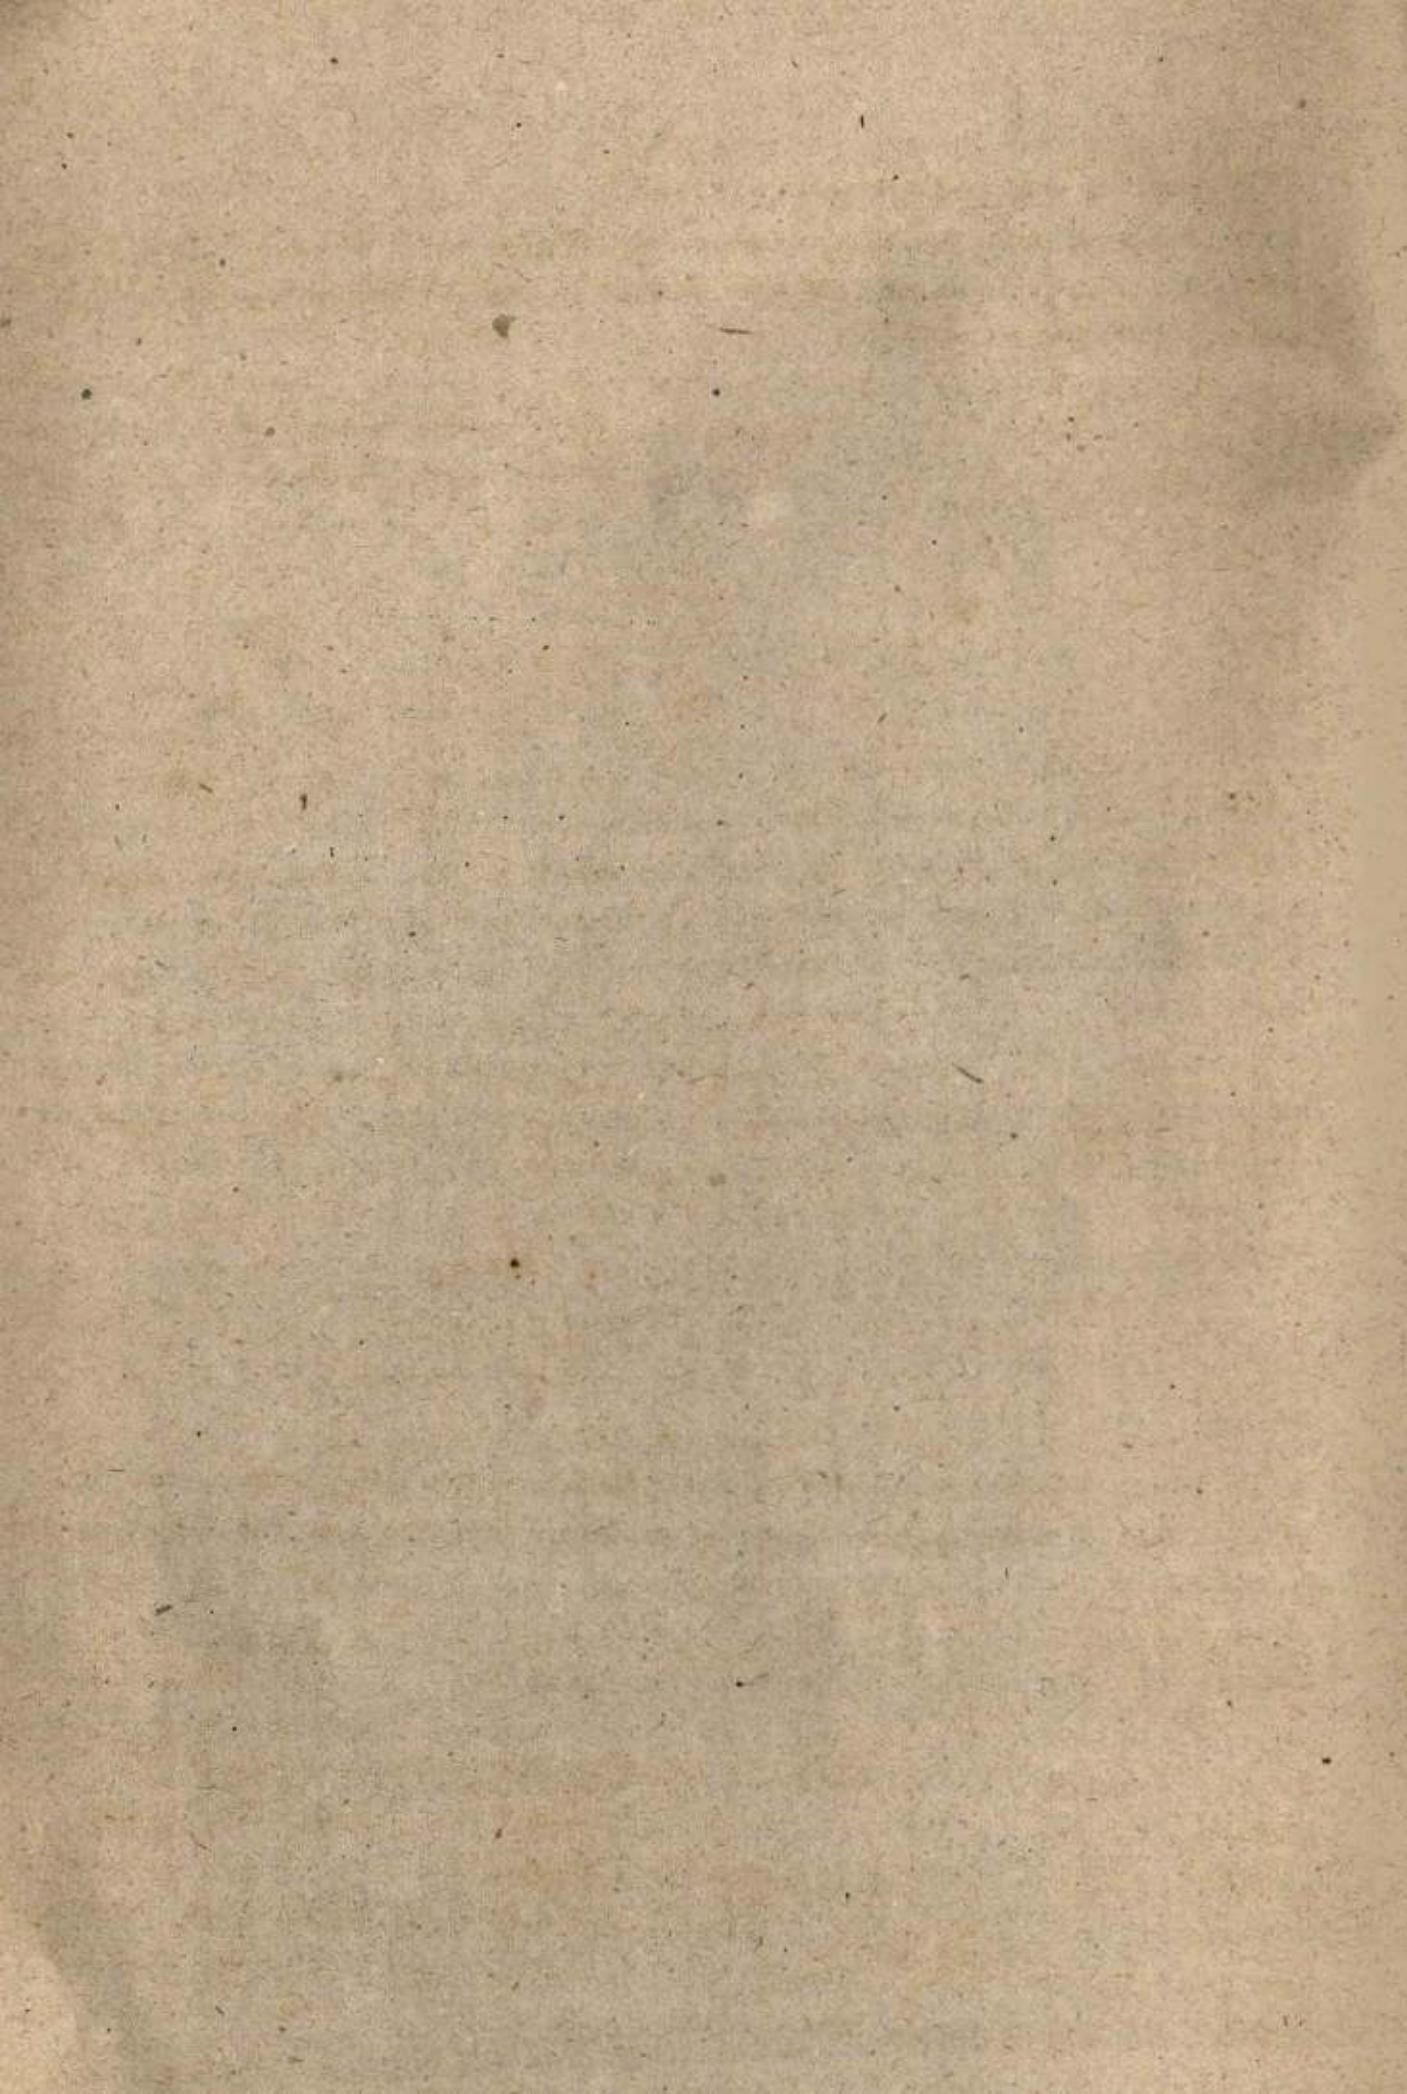

The sample holdings were classified into three size groups viz. small, medium and large on the basis of the area under the crop as shown below:

<u>Crop</u>	<u>Size class</u>	<u>Area of the holding</u>
Paddy	Small	.. Below 0.40 Hectare
	Medium	.. 0.40 to 2 Hectare
	Large	.. 2 Hectares & above
All other crops	Small	.. Below 0.20 Hectare
	Medium	.. 0.20 to 0.80 Hectare
	Large	.. 0.80 Hectare and above

The data collected from the above mentioned three size classes of cultivators were tabulated district-wise and analysed. The proportion of each type of disposal to the total production of each crop, reported to have been received by the three size classes of selected cultivators has been worked out separately for each district. The disposal pattern (in percentages) considering the three size classes of cultivators together has been worked out by taking the weighted average of the percentages of each type of disposal in respect of the small, medium and large size cultivators (weights being area under the crop of the respective size group).

The quantum of marketable surplus is inclusive of the quantity sold at farm site or at market and also that reported to have been stored for future sale.

The percentage of marketable surplus has been worked out on the basis of the data collected during the survey. The quantum of marketable surplus has been calculated on the basis of the gross production estimates of each crop in each district under the EARAS Scheme and using the percentage of marketable surplus arrived at, on the basis of the survey. In this context, special mention has to be made that in some cases, the gross quantity sold at farm site/market was not the surplus in excess of domestic consumption; it also includes the quantity sold to meet the day to day expenditure of the cultivator. This aspect may have to be borne in mind while using the data on marketable surplus.

Limitations: During the year 1983-84, the survey was planned and conducted in the twelve Revenue districts as they existed prior to the formation of the Pathanamthitta and Kasaragode Districts. Hence, the names of these two districts have not been shown in the different tables given for the year 1983-84. The data presented in the tables therefore relate to the above 12 districts as existed at the time of the survey i.e. before the formation of the two new districts.

The number of sample cultivators selected in each taluk was fixed as 10 each in respect of paddy, coconut and tapioca and 5 each in respect of other crops. Therefore, the total size of sample in a district was inadequate and hence the results at the district level will be subject to much sampling error.

1. Paddy: Paddy is the most important seasonal crop cultivated in the State in terms of area, covering about 26% of the gross cropped area. The crop is grown during the three seasons viz. Autumn, Winter and Summer. The data relating to each of the seasons collected from the sample cultivators were tabulated and analysed separately. Marketable surplus of paddy for the three seasons together has also been workedout.

1.1 Paddy - Autumn Season:

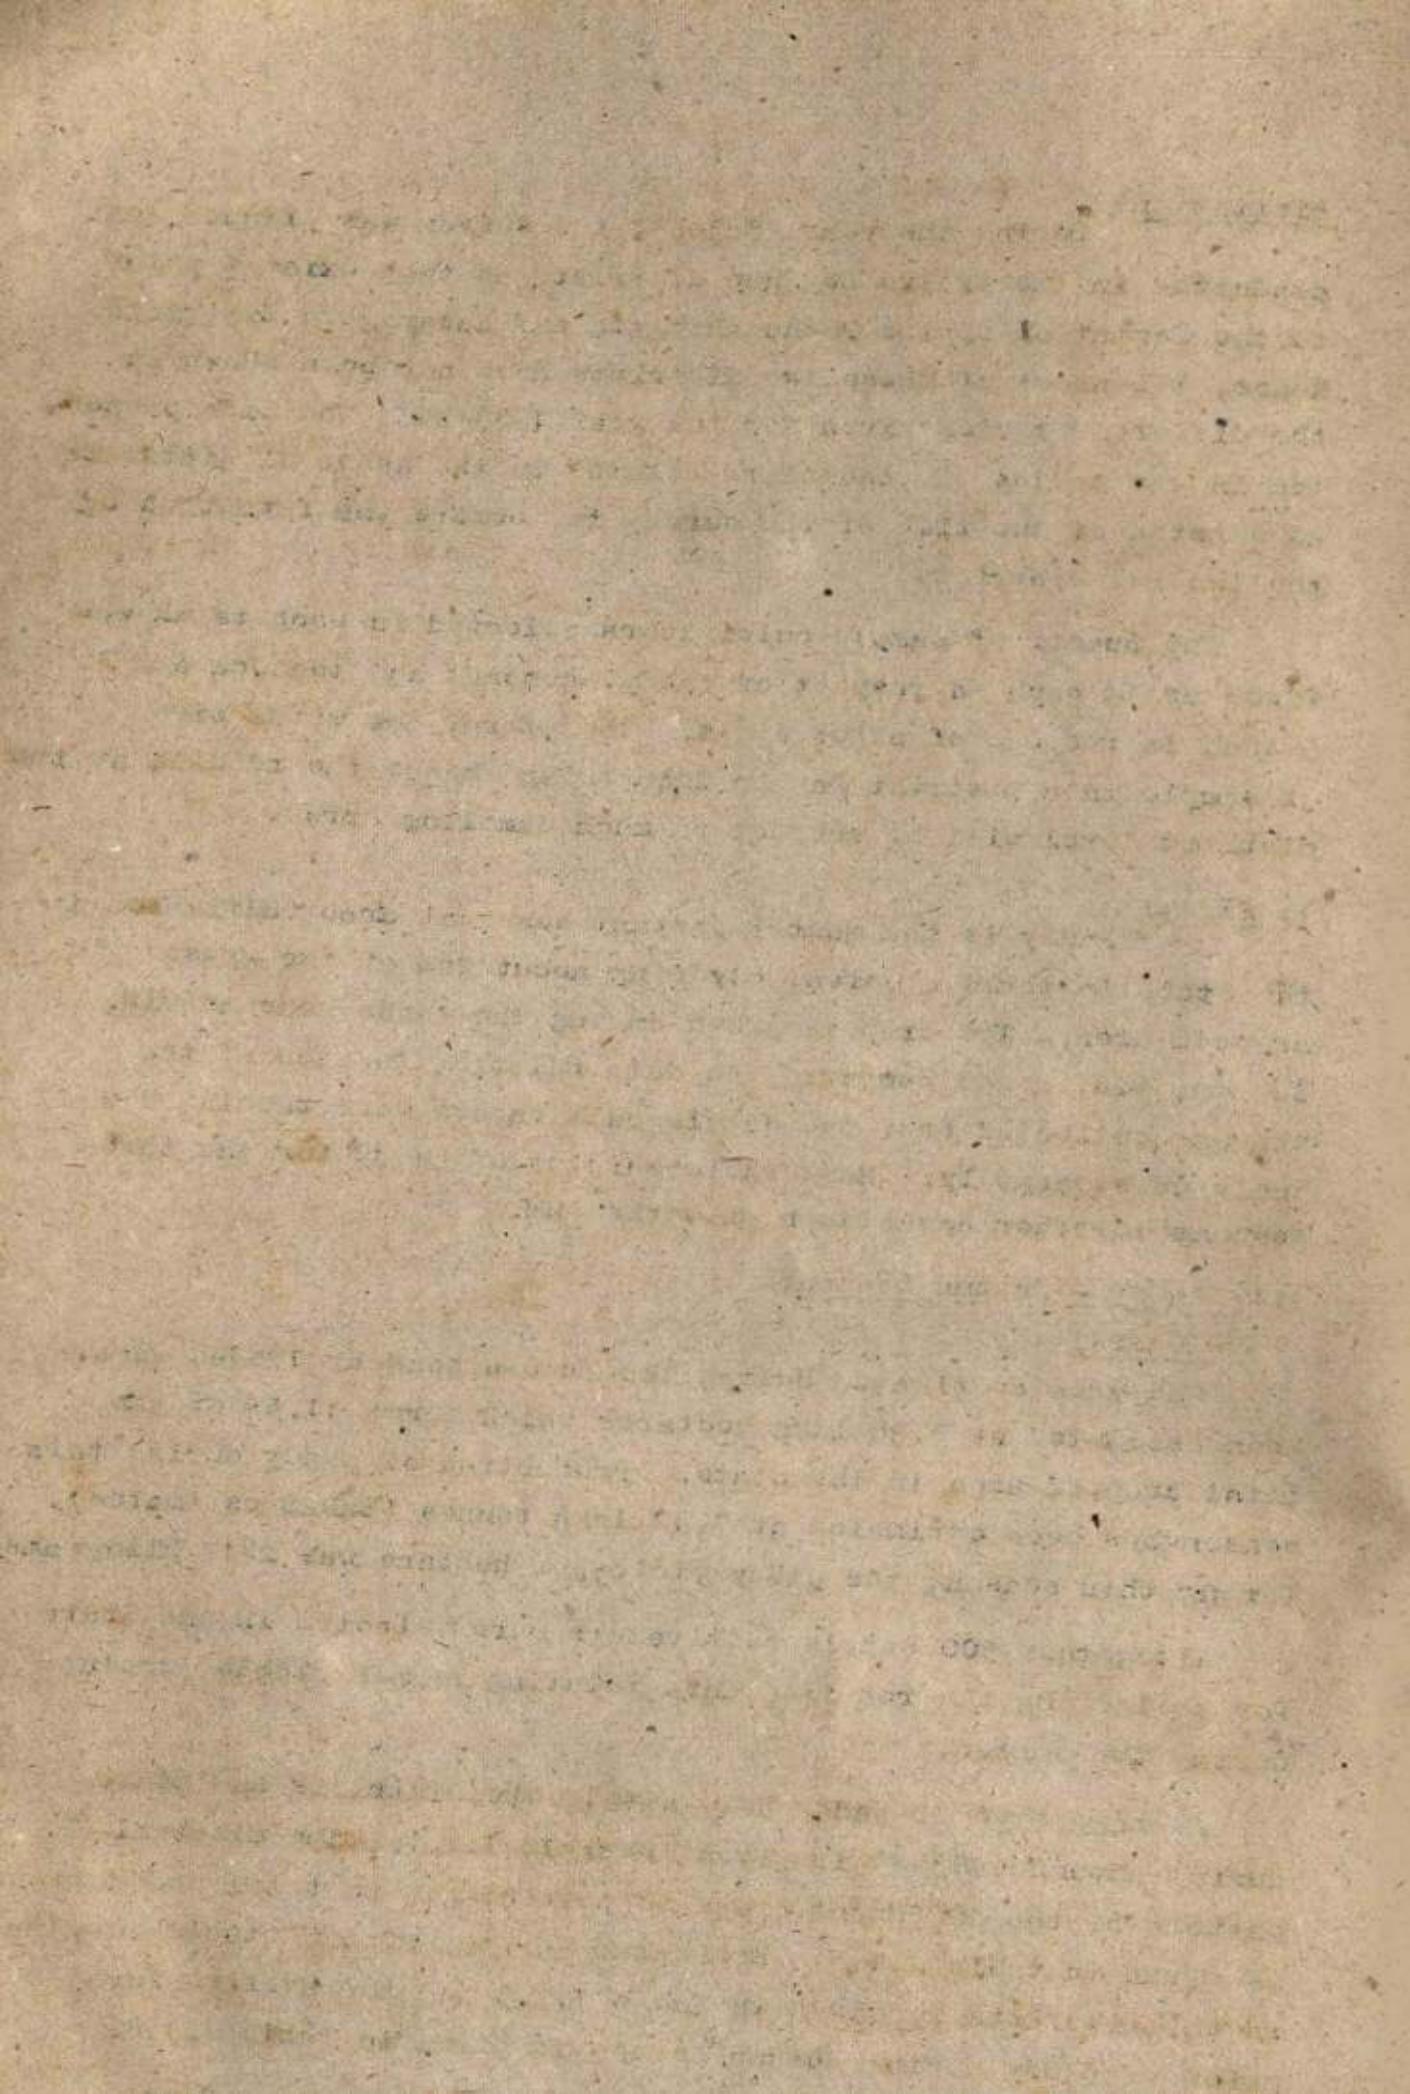

General:

The area cultivated during the Autumn season, 1983-84 has been estimated at 3.28 lakh hectares which forms 11.5% of the total cropped area in the State. Production of paddy during this season has been estimated at 7.92 lakh tonnes (EARAS estimates). During this season, the paddy yield per hectare was 2417 kilograms.

Altogether 500 sample cultivators were selected in the State for collecting the required data relating to marketable surplus during the season.

Average size of paddy holdings in the districts and State during Autumn 1983-84 is given in table 1.1.1. The disposal pattern of the different crops as percentages to total production is given in table 1.1.2. Estimated quantum of marketable surplus in the districts is given in table 1.1.3 and the average farm price of paddy during Autumn season is given in table 1.1.4.

Contd.....

The value of marketable surplus is given as table 1.1.5.

On analysing the total production by types of disposal, it is found that a sizeable portion of the total produce is used for "own consumption". This accounted for about 47% of the production in the State.

About 6% of the total produce is utilised as 'seed' and about 11% as 'labour charges'. It may be noted that the quantum of the crop disbursed as labour charges does not give the total labour charges since cash payments are also made.

It is also to be noted that due to various factors, the percentage share of various modes of disposal varies widely between different districts.

Marketable surplus:

During Autumn season 1983-84, marketable surplus of paddy accounted for about 35.5% of the production in the State.

Marketable surplus of paddy has not been reported from Trivandrum and Kozhikode districts.

"Own consumption". This accounted for about 47% of the production in the State.

The quantum of marketable surplus of paddy for the season estimated on the basis of the total production estimates available from the EARAS Scheme, was about 2.82 lakh tonnes, out of the total production of 7.92 lakh tonnes. The largest quantity of marketable surplus was from Palghat District with 1.27 lakh tonnes. Ernakulam, Alleppey and Cannanore districts follow next in the order - the quantum in these districts being 41,836 tonnes, 39460 tonnes and 33706 tonnes respectively.

Area grown under paddy in Wynad District during the season was only nominal.

1.2 Paddy - Winter Season

1983-84, marketable surplus of paddy accounted for about 35.5% of the production in the State.

General:

The area under paddy during Winter season of 1983-84 has been estimated at about 3.25 lakh hectares which accounts for 11.3% of the total cropped area. Total production of paddy in the State during this period has been estimated at 7.92 lakh tonnes. The average yield per hectare of paddy was 2441 Kg.

Data collected from 474 sample cultivators were analysed for the study. Average size of paddy holdings in the different districts follow next in the order - the quantum in these districts being 44,874.50 acres.

Contd...

1. *Constitutive* *protection* *of* *the* *right* *to* *work* *and* *the* *right* *to* *rest*

districts and State is given in Table 1.2.1. In table 1.2.2, proportion of the different types of disposals to total production is given. Estimated quantum of marketable surplus of paddy in the different districts is given in Table 1.2.3 and the average farm price of paddy in the different districts is given in Table 1.2.4. The value of marketable surplus is given in table 1.2.5.

Findings:

On analysing the total production by types of disposals, it is seen that a major share of the produce (about 49%) is used for 'own consumption' in the State. The quantity used as seed was about 7.3%. About 10% was spent as labour charges.

Marketable Surplus:

As stated earlier, the quantity of paddy sold at farm site or in the market may not be the total surplus after home use. Marketable surplus is inclusive of the quantity stored by the cultivators for future sale. On a close study of the disposal pattern of the total produce, it is seen that marketable surplus is 33% of the produce in the State. During this season, marketable surplus of paddy has not been reported from Trivandrum, Malappuram and Kozhikode districts.

In terms of quantum of marketable surplus of paddy during Winter (Mundakan) season, it is seen that surplus is highest in Palghat District (1.08 lakh tonnes) followed by Wynad (40106 tonnes) and Ernakulam (37744 tonnes). The total marketable surplus in the State comes to about 2.61 lakh tonnes.

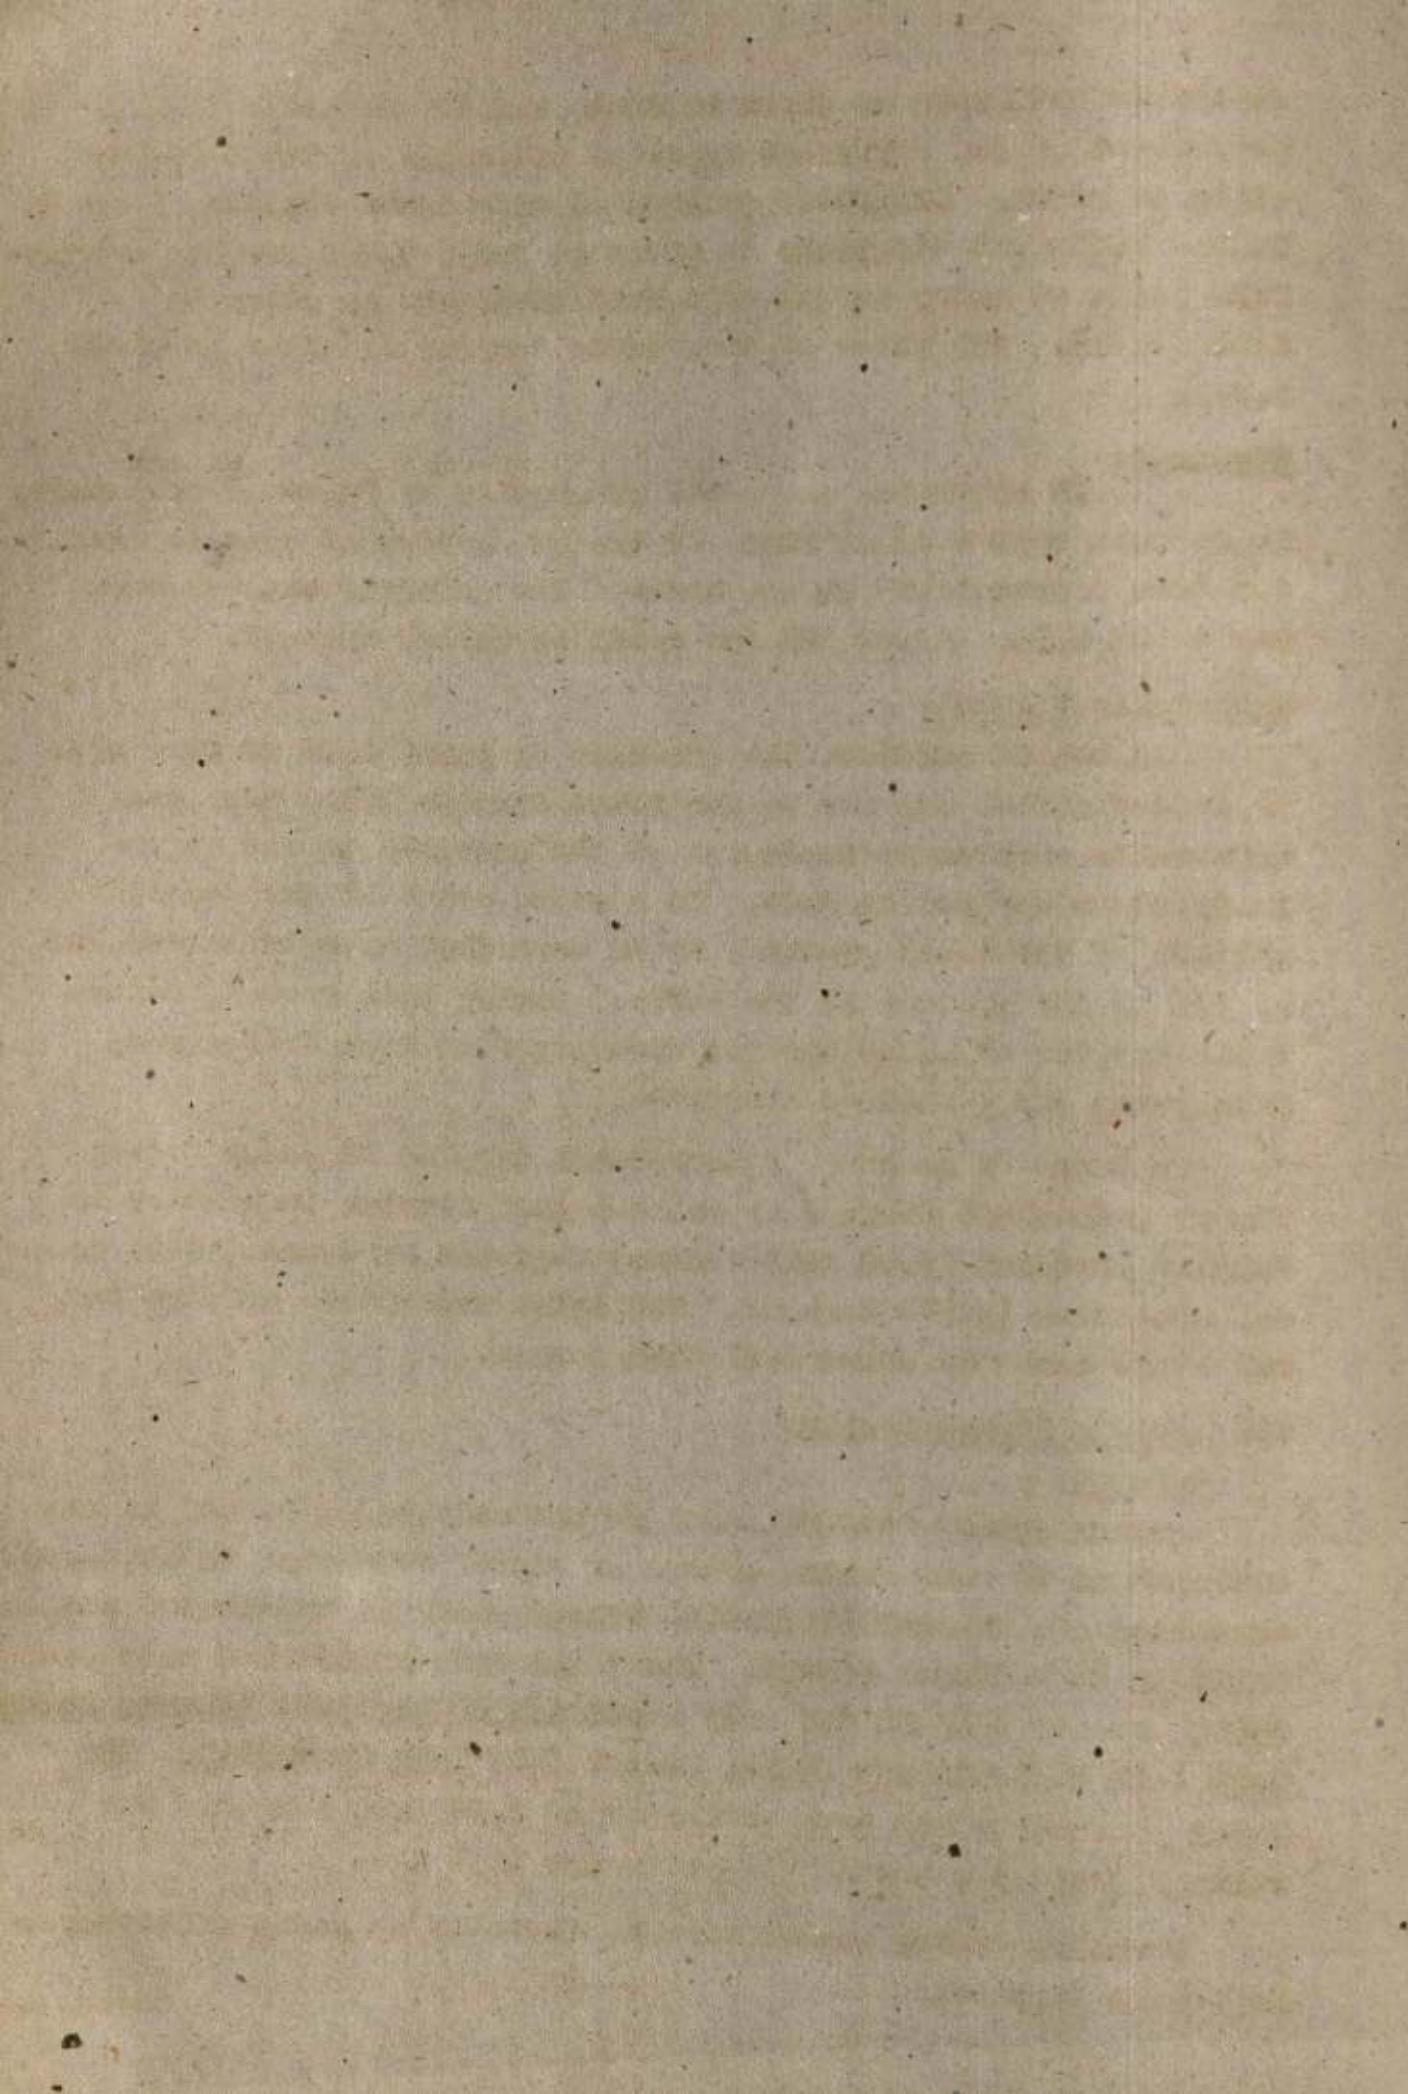

1.3 Paddy - Summer Season:

General:

During summer season, paddy is not cultivated widely in any district as is done during Autumn or Winter seasons. In Alleppey, Ernakulam and Trichur Districts, summer paddy is cultivated comparatively to a larger extent. The total area cultivated with paddy during summer 1983-84 was only about 87,700 hectares (during Autumn 3.28 lakh Hectares and during Winter 3.25 lakh hectares). The total production has been estimated at 2.54 lakh tonnes. The average yield per hectare of paddy was 2894 Kgs.

Usually, during summer season, there is no paddy cultivation in Idukki District.

Contd....

Altogether 434 sample cultivators were selected for collecting the required particulars. Average size of a paddy holding in each district is given in Table 1.3.1. Percentage distribution of the total production by types of disposal is shown in Table 1.3.2. Details regarding the quantum of marketable surplus in the districts are given in Table 1.3.3. Average farm prices of paddy prevailed during summer 1983-84 in the different districts are given in Table 1.3.4. The value of marketable surplus is given in Table 1.3.5.

Findings:

It is seen that out of the different types of disposal of the produce, own consumption accounted for 39% in the State. About 7% of the produce is used as seed and 9.3% given for labour charges. The disposal pattern, however, did not show any uniform trend in the different districts.

Altogether 434 sample cultivators were selected for

Marketable surplus: particulars. Average size of a paddy holding

It was found that marketable surplus of paddy during summer season accounted for 43.5% of the produce in the State. The major contributor of marketable surplus during this season is Alleppey the district where the total quantity of marketable surplus of paddy has been estimated at 61441 tonnes. This district accounted for the highest percentage of marketable surplus also for the season among the districts. Out of a total estimated production of 2.54 lakh tonnes of paddy during summer (Punja) season in the State, the quantum of marketable surplus has been estimated at 1.10 lakh tonnes.

It is seen that out of the different types of disposal of the produce, own consumption accounted for 39% in the State.

Considering the three seasons together, the marketable surplus of paddy in the State accounts for 35.5% of the total production of 18.38 lakh tonnes. This works out to more than 6.53 lakh tonnes.

Altogether 434 sample cultivators were selected for

2. Coconut: particulars. Average size of a paddy holding

It was found that marketable surplus of paddy during summer season accounted for 43.5% of the produce in the State. The major

Coconut is an important cash crop of the State accounting for about 24% of the gross cropped area. During 1983-84, about 6.8 lakh hectares was under coconut cultivation. In Kozhikode district, almost 50% of the total cropped area is under coconut cultivation. The corresponding percentages in other major coconut growing

districts of the State are given in Table 1.3.1. The average size of a paddy holding during summer (Punja) season in the State, the

quantum of marketable surplus has been estimated at 1.10 lakh tonnes.

It is seen that out of the different types of disposal of the produce, own consumption accounted for 10% in the State.

Contd....

districts viz. Trivandrum, Quilon and Alleppey are 33, 31 and 28 respectively. The total production during 1983-84 has been estimated at 2602 million nuts.

Altogether 505 sample cultivators were selected for the study in the State. The total yield reported to have been obtained by these cultivators was analysed to study the disposal pattern of the produce and to estimate the quantum of marketable surplus which is inclusive of both the quantity marketed as well as that stored for future sale. Table 2.1 gives the average size of coconut holdings held by the cultivators in each district. The disposal pattern of the produce by types of disposal is shown in Table 2.2. Estimated quantum of marketable surplus of coconut in the different districts is given as Table 2.3 and the average annual farm prices of coconut are given in Table 2.4. The value of marketable surplus is shown in Table 2.5.

Findings:

*It is seen that about 23.6% of the total production is used for own consumption by the cultivators. Coconut given as labour charges works out to 1.7% of the total production. This does not however represent the rate of labour charges, but shows the labour charge given in kind to the labourers in addition to cash payment.

Marketable surplus:

Disposal pattern shows that a sizeable portion of the total production in the State goes for sale. Marketable Surplus accounted for about 73.5% of the production. It is found that comparatively larger portion (more than 80%) of the total production is available as marketable surplus in the following districts.

<u>District</u>	<u>Percentage of marketable surplus</u>
Trichur	85.8
Ernakulam	83.9
Kozhikode	83.8
Malappuram	82.6
Kottayam	80.0

In assessing the quantum of marketable surplus, besides the quantities sold in the market and at the farm site, the quantity stored for future sale was also taken into account. The survey results showed that about 15% was stored for future sale in the state.

Contd....

: 8 :

: B :

On a close perusal of the quantum of marketable surplus in the different districts, it was found that the largest quantum of marketable surplus was in Kozhikode district followed by Trichur, Ernakulam and Cannanore in the order. The total quantity of marketable surplus in the above districts is shown below.

<u>District</u>	<u>Marketable surplus (in million nuts)</u>
Kozhikode	460.1
Trichur	276.3
Ernakulam	221.5
Cannanore	199.4

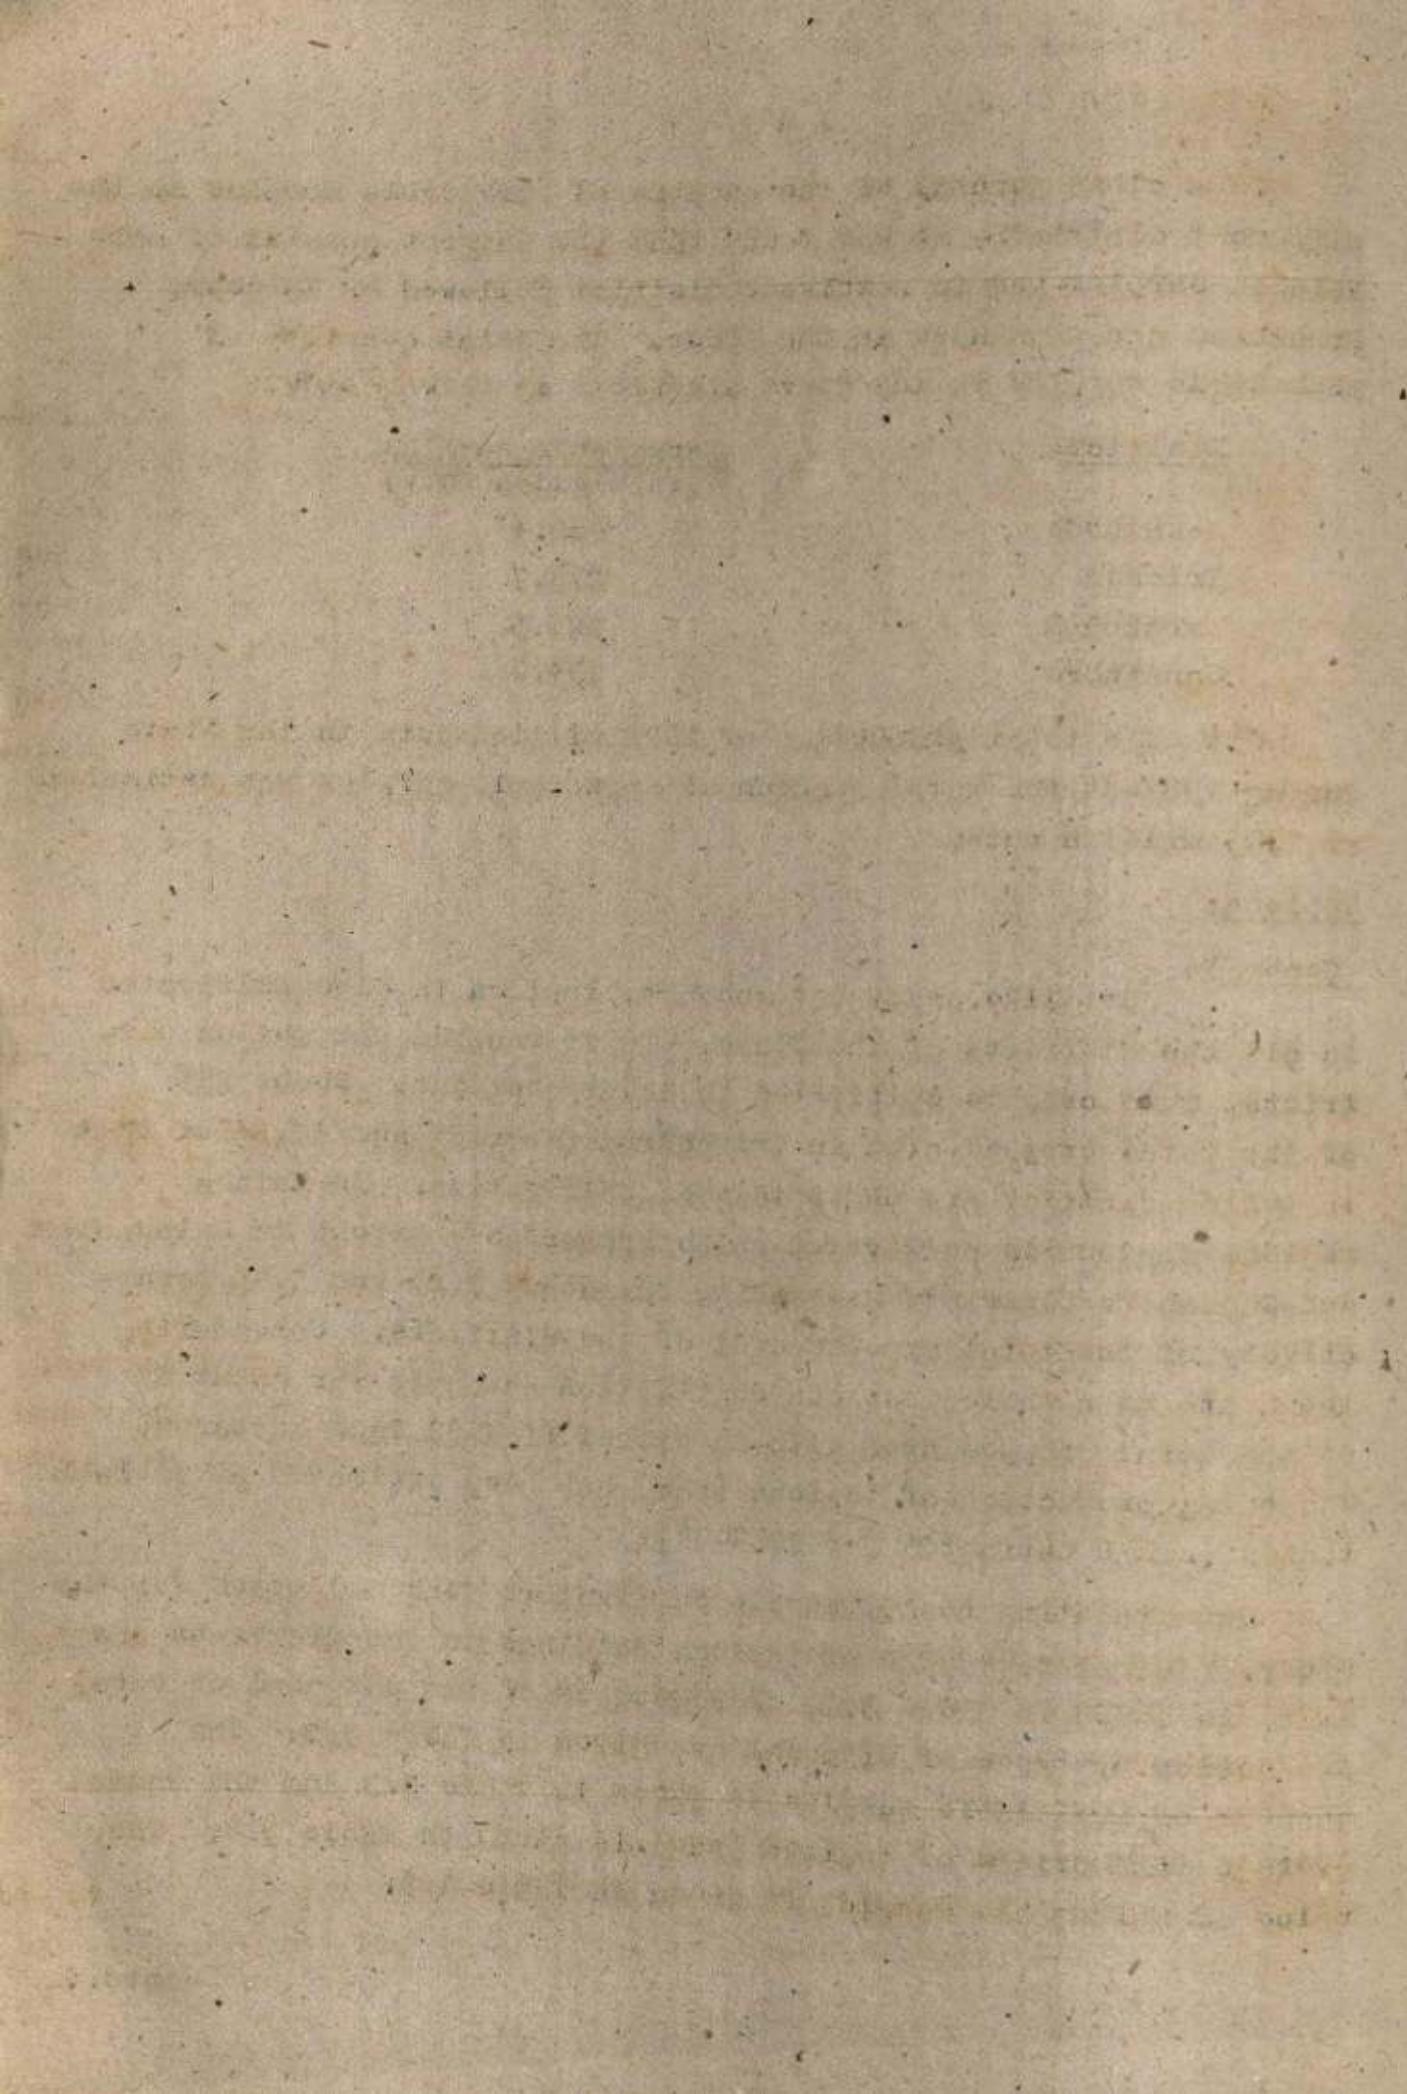

Out of a total production of 2602 million nuts in the State during 1983-84 the total quantum of marketable surplus was estimated at 1883 million nuts.

Tapioca:

General:

Just like paddy and coconut, tapioca is also cultivated in all the districts of the State. In Trivandrum and Quilon districts, this crop is cultivated to a large extent. About 25% of the total cropped area in Trivandrum district and 17.5% of that in Quilon district are under tapioca cultivation. In Malabar region, tapioca is cultivated in an appreciable extent in Malappuram and Cannanore districts accounting for about 7.2% and 5.4% respectively of the total cropped area of the districts. Considering the State as a whole, tapioca cultivation accounts for about 8% of the total cropped area with an extent of 2.33 lakh hectares. The total production of tapioca (raw) has been estimated at 39 lakh tonnes (EARAS estimates for 1983-84).

Data relating to 407 sample cultivators were collected for the study. The average size of tapioca holdings in the districts and State is shown in Table 3.1. Percentages of the disposal of total production by types of disposal are given in Table 3.2. The quantum of marketable surplus is given in Table 3.3 and the annual average farm prices of tapioca (raw) is given in Table 3.4. The value of marketable surplus is given in Table 3.5.

Findings:

On an average 30.8% of the production of tapioca is used for own consumption in State. It is found that 2.8% of the production is used as cattle food in the State.

Marketable surplus:

Sales of tapioca by the farmers are generally made at farm site. About 64.6% of the total production in the State was available as marketable surplus. In Malappuram, Trichur and Kozhikode districts, marketable surplus accounted for more than 80% of the production. Out of a total production of more than 39 lakh tonnes (estimated) of raw tapioca in the State, marketable surplus works out to 25.2 lakh tonnes. Trivandrum district with a marketable surplus of 7.85 lakh tonnes, has the largest quantum of marketable surplus. Quilon, Kottayam, Alleppey and Cannanore districts follow next in order each having more than 2 lakh tonnes of raw tapioca as marketable surplus.

4. Arecanut:

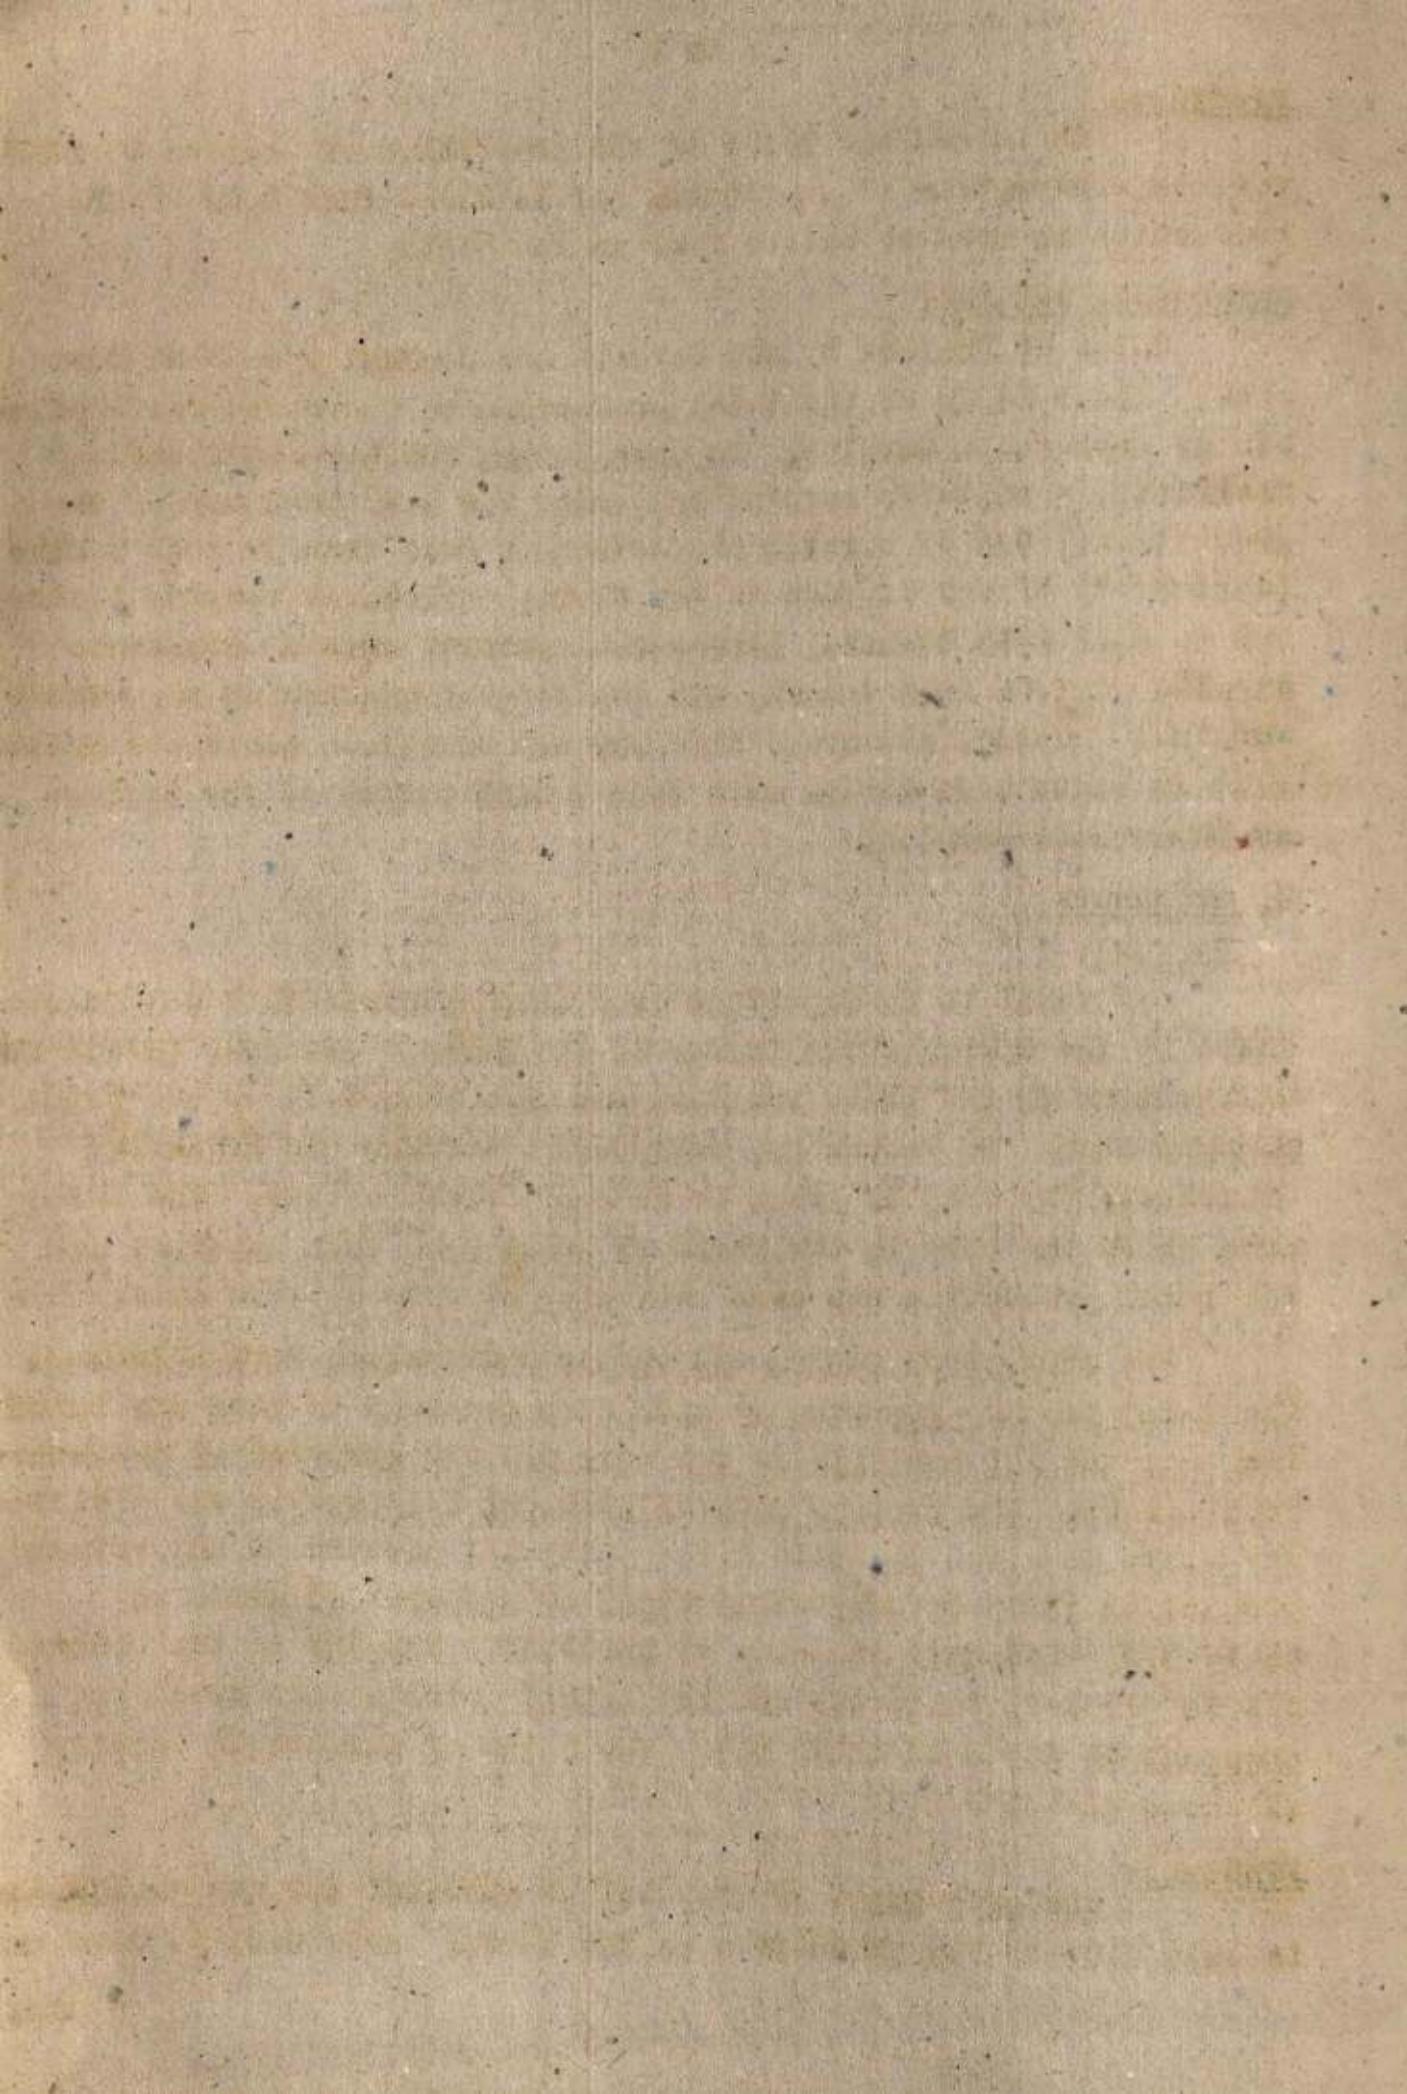

General:

Arecanut is an important crop which contribute a considerable share of the agricultural income in the State. Arecanut (Betel nut) cultivation in the State accounts for more than 2.1% of the total cropped area. In Cannanore, Malappuram, Trichur and Ernakulam districts, the crop is grown to an appreciable extent. The total area under the crop in the State is about 0.60 lakh hectares and the total production has been estimated at 8318 million nuts.

For analytical study, 223 sample cultivators were selected. The total produce reported to have been received by them was taken into account for analysis of the data and for arriving at necessary conclusions. The average size of arecanut holdings in the district and State is given in Table 4.1. Disposal pattern of the total production (in percentages) by types of disposal is given in table 4.2. Estimated quantum of marketable surplus in the districts is given in table 4.3 and the annual average farm price of arecanut is shown in table 4.4. The value of marketable surplus is shown in Table 4.5.

Findings:

The percentage of disposal of arecanut for own consumption is only 6.4% of the production in the State. Only 0.6% is used as

seed. Major portion of the produce is either sold or stored for future sale.

Marketable surplus:

More than 92% of the production was available as marketable surplus in the State. It is reported that out of the total production, 18.5% is wholly stored for future sale and the rest was sold in the market and at the farm site. It is found that the maximum quantity of marketable surplus was from Cannanore district (2128 million nuts) closely followed by Malappuram, Trichur, Kozhikode and Ernakulam districts. The total quantum of marketable surplus in the State was found to be 7665 million nuts in 1983-84.

5. Pepper:

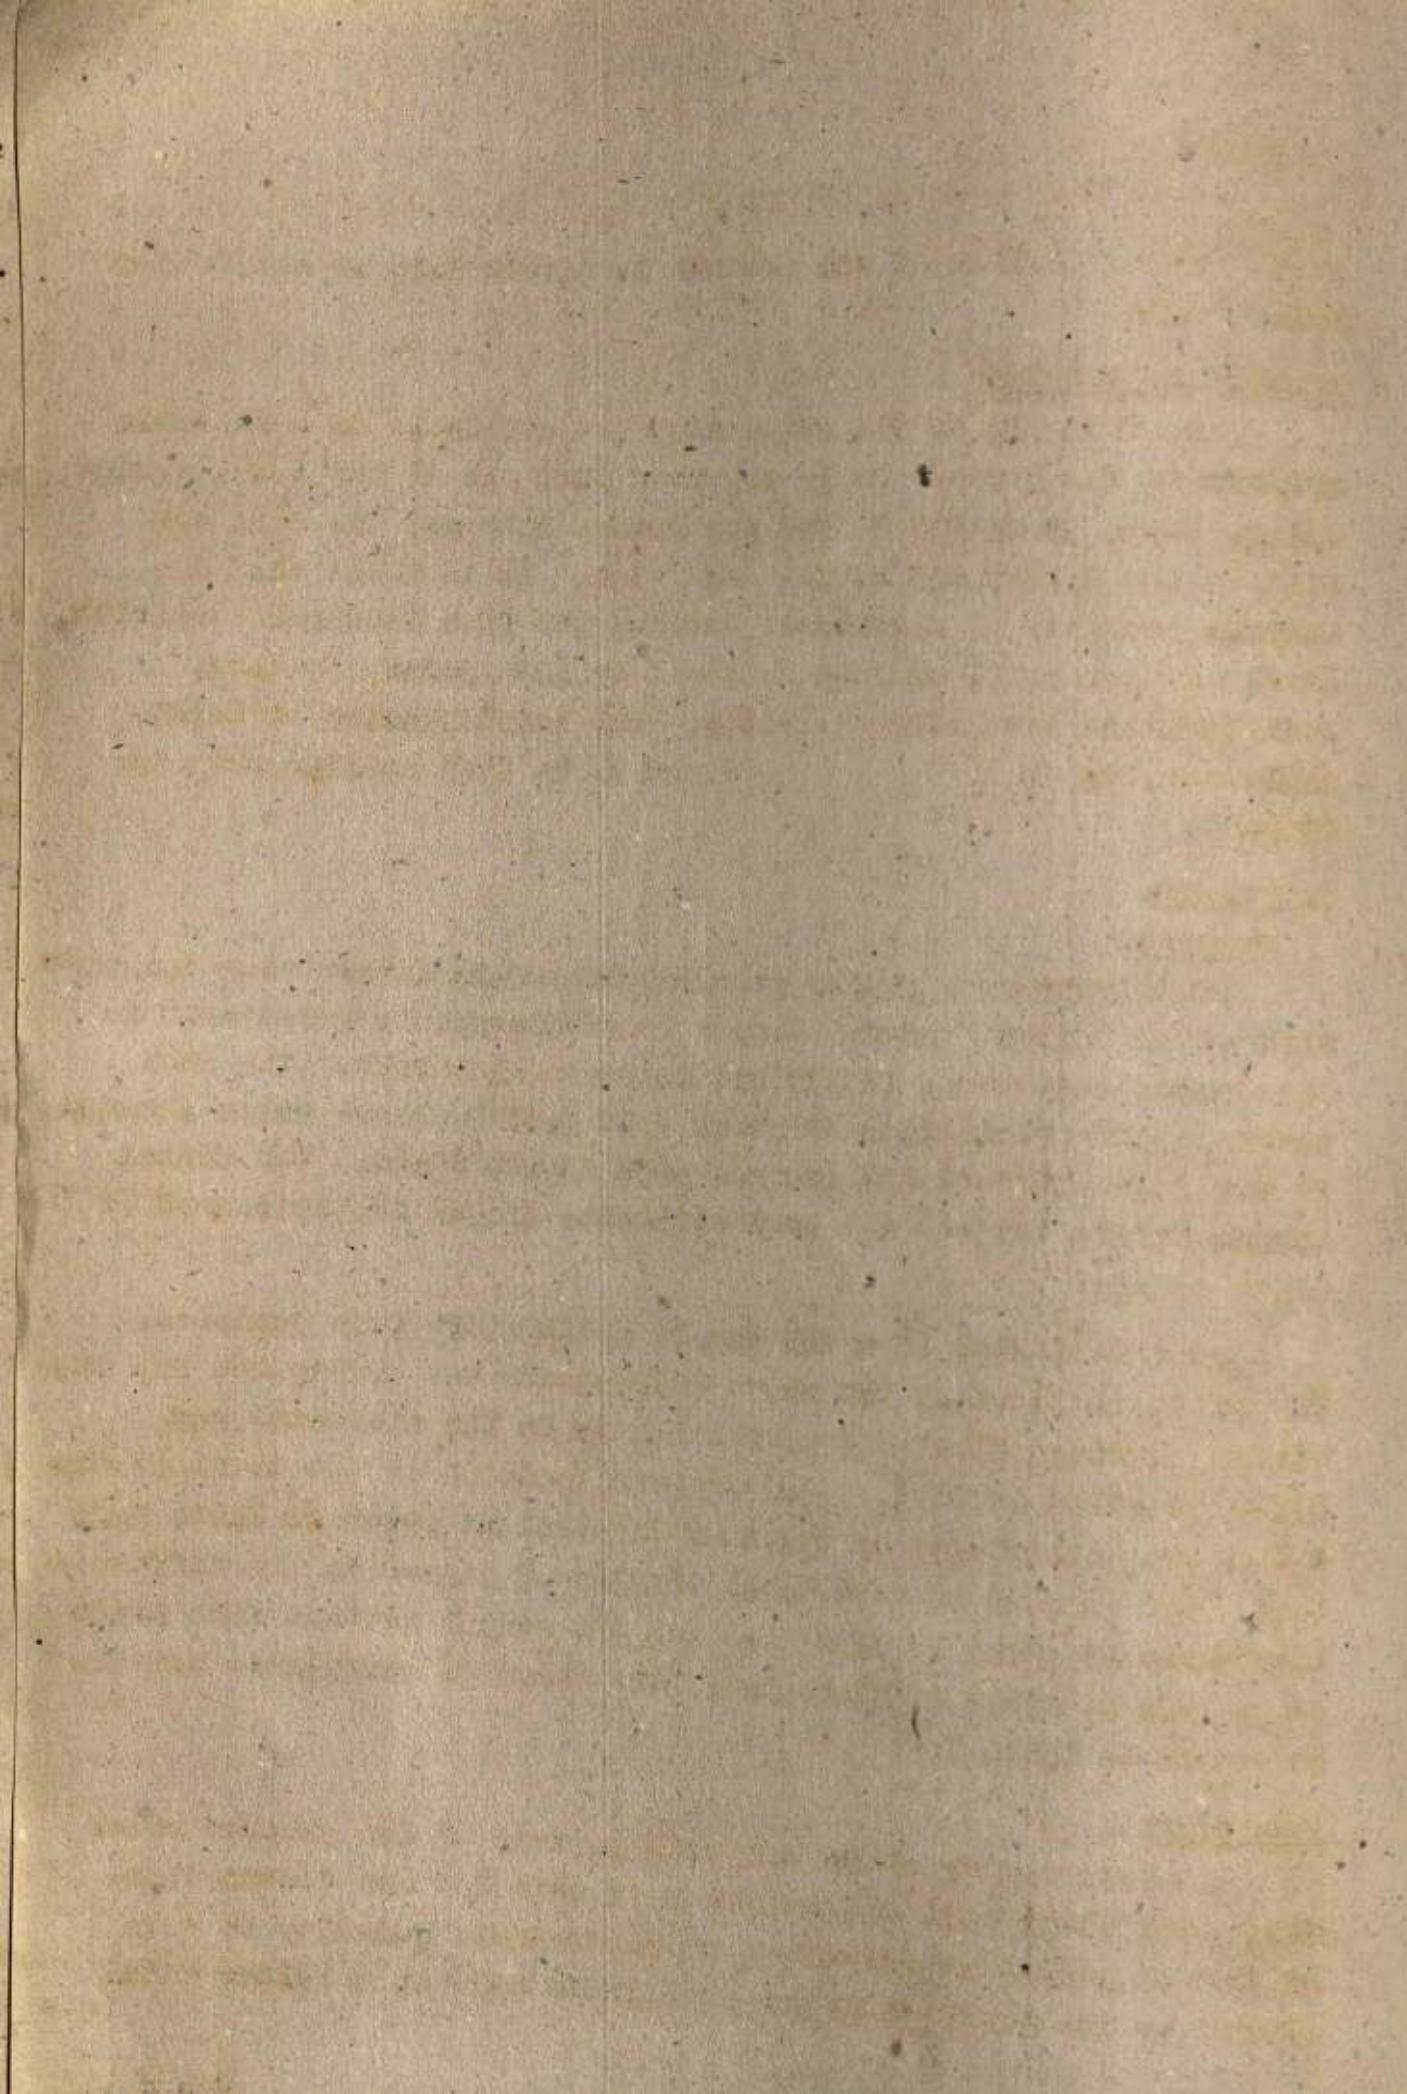

General:

Cultivation of pepper is concentrated in Kerala when compared with other Indian States. Pepper is predominantly cultivated in Cannanore, Kozhikode, Idukki and Kottayam districts. The area under pepper cultivation is about 1.06 lakh hectares which accounts for 3.7% of the total cropped area in the State. The annual output during 1983-84 has been estimated around 24,500 tonnes of black pepper.

Data collected from 185 sample cultivators were analysed. The yield obtained by the above cultivators was considered for the study. Average size of pepper holdings in the districts and State is given in Table 5.1. Disposal pattern of the total production (in percentage) by types of disposal is given in Table 5.2. Estimated quantum of marketable surplus of pepper in the different districts is given in Table 5.3 and the annual average farm price of pepper is given in Table 5.4. The value of marketable surplus is shown in Table 5.5.

Findings:

A close review of the disposal pattern of the produce shows that only about 7.2% of production is used for own consumption. As far as pepper is concerned, an appreciable quantity is seen stored by the cultivators for profitable sale at a future date.

Marketable surplus:

It is seen that about 71.5% of the produce was marketed and 21% stored for future sale. Thus the total marketable surplus in the State works out to 92.5% of the total production, while about 33% of the total produce is sold at market, more than 36% is seen sold at farm site. Cannanore district had the largest quantum of marketable surplus in the State and during the year under study about 6000 tonnes of black pepper was available as marketable surplus in the district. Kozhikode, Wynad, Kottayam, Idukki, Quilon and Ernakulam districts follow in the order as is evident from the table below:

<u>District</u>	<u>Marketable surplus (in tonnes)</u>
Cannanore	5997.9
Kozhikode	3142.6
Wynad	2910.4
Kottayam	2351.8
Idukki	2234.0
Quilon	2029.5
Ernakulam	1034.3

All other districts had less than 1000 tonnes each of marketable surplus of (black) pepper. The estimated total quantum of marketable surplus of pepper during 1983-84 in the State was found to be more than 22700 tonnes of black pepper.

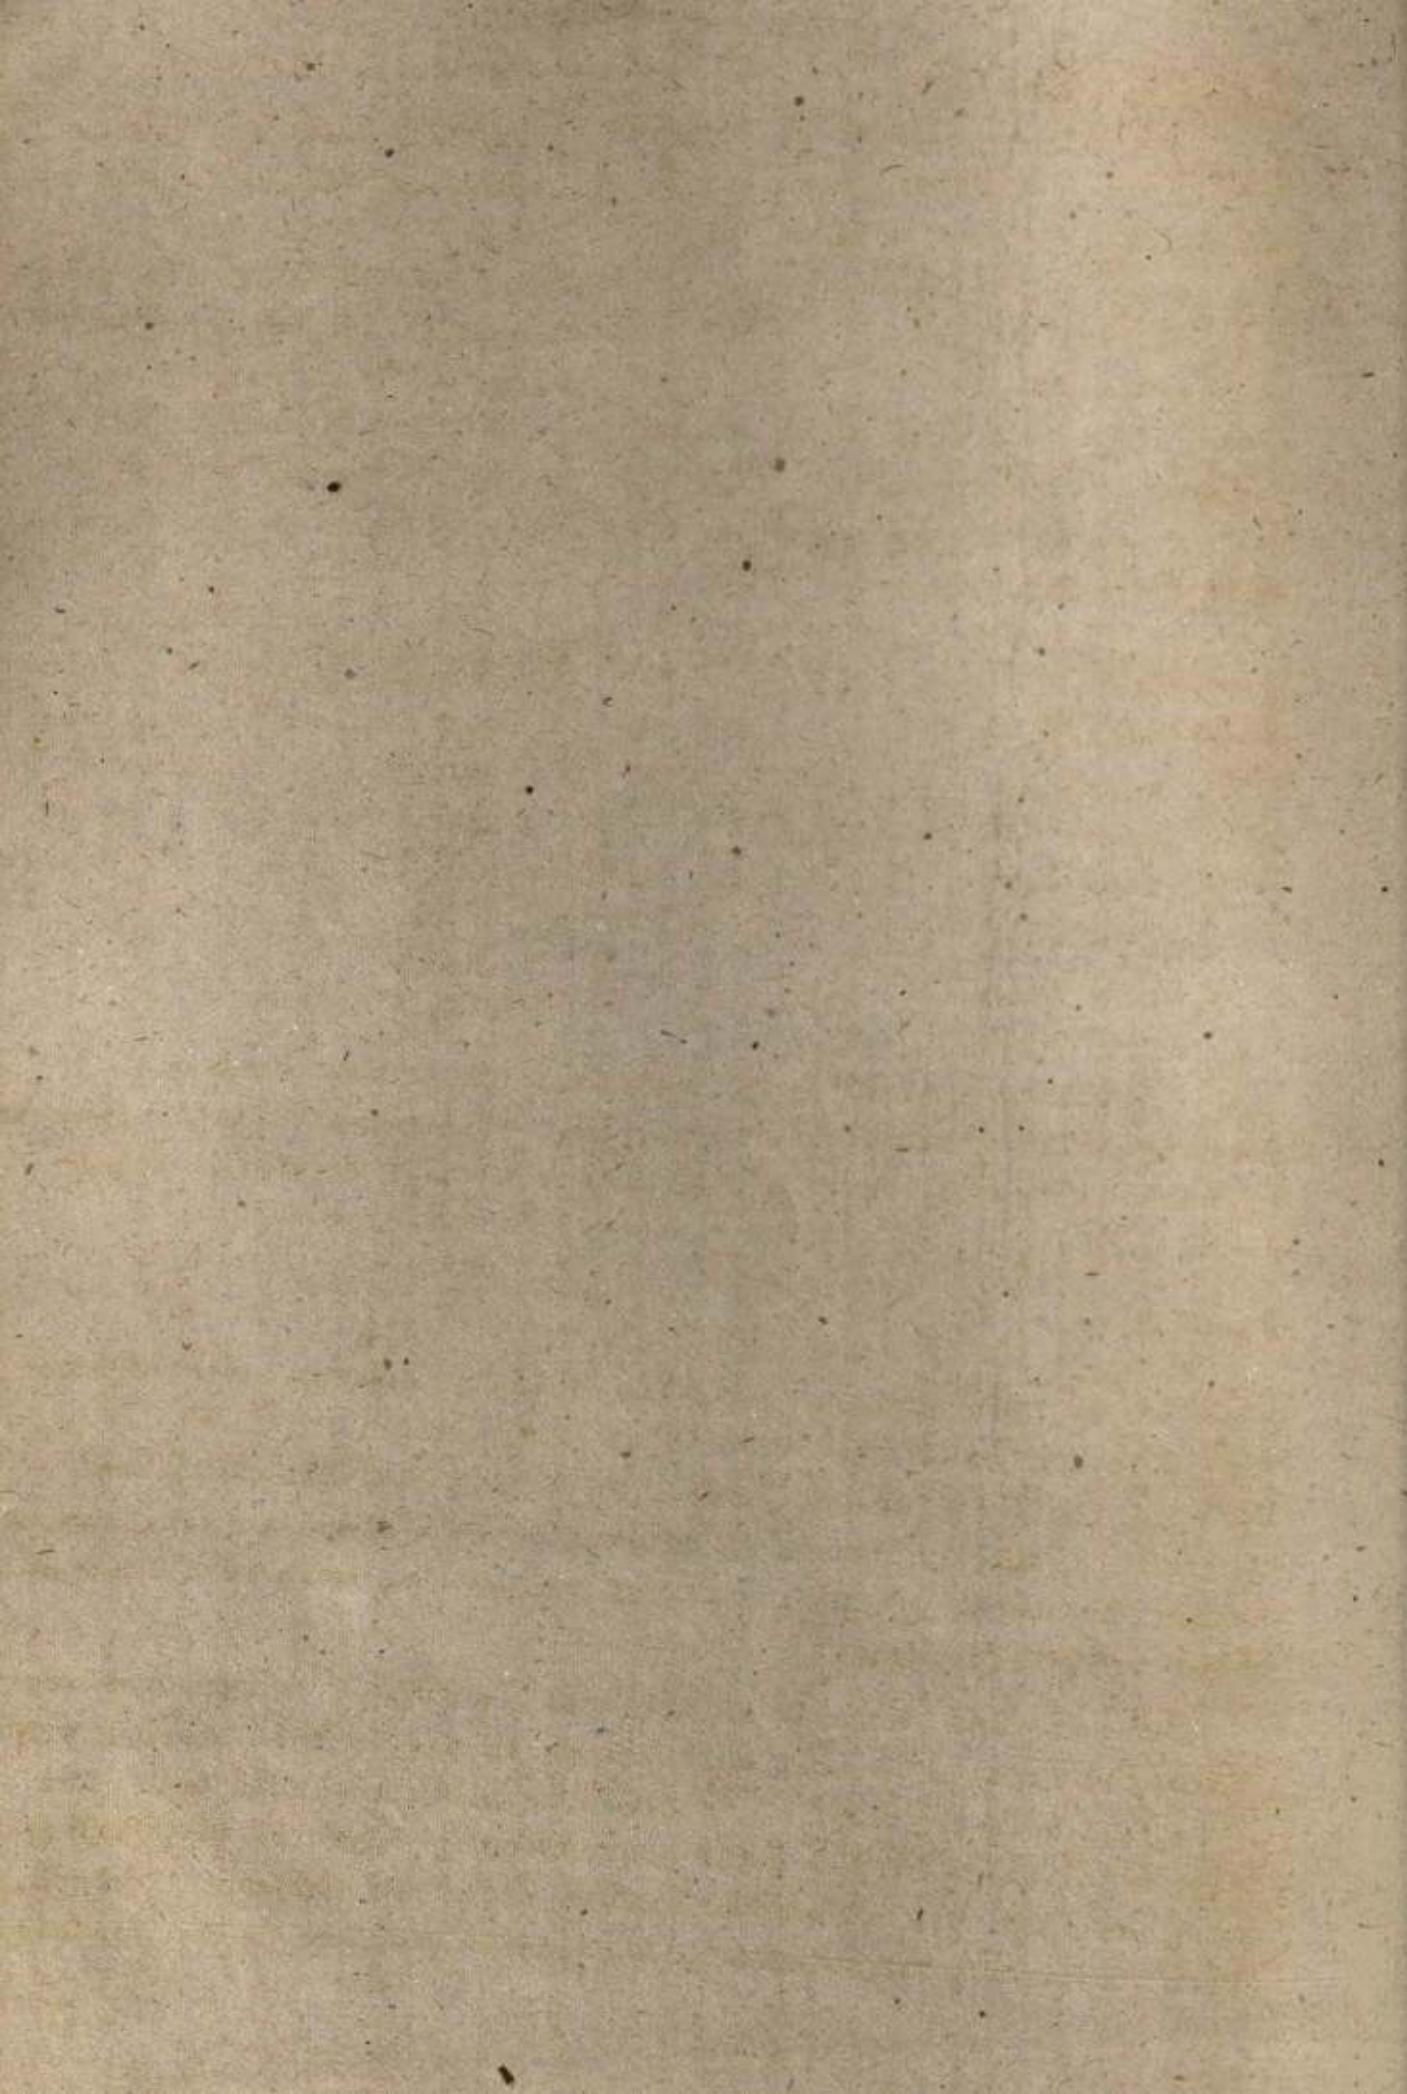

6. Banana:

General:

During the year under report, about 15,000 hectares of area was under banana cultivation in the State which accounts for about 0.5% of the total cropped area. In Malappuram, Ernakulam and Trichur districts, banana is cultivated in a comparatively larger area. The total production during 1983-84 has been estimated at about 1.78 lakh tonnes.

The required details on disposal pattern of the produce were collected from 167 sample cultivators in the State. Average size of banana holdings in the districts is given in Table 6.1. The disposal pattern of the total production by types of disposal is shown in Table 6.2 as percentages to total production. Table 6.3 gives the estimated quantum of marketable surplus in the districts.

Contd....

and table 6.4 shows the annual average farm price of banana in the different districts. Table 6.5 gives the value of marketable surplus.

Findings:

A close study of the disposal pattern of banana reveals that about 10% of the total production is used for own consumption in the State. In Palghat, Idukki, Wynad, Quilon, Alleppey and Trichur districts, more than 15% of the production in the district was used for own consumption. However, no uniform trend is seen in the disposal of this item in different districts.

Marketable surplus:

Almost 90% of the total production in the State is reported as marketable surplus. The largest quantity of marketable surplus was available in Malappuram district - 28547 tonnes of banana was seen sold from this district. Ernakulam and Kottayam districts come next in the order having sold an estimated quantity of about 21930 tonnes, 20258 tonnes respectively. The quantum of marketable surplus in the State was about 1.60 lakh tonnes.

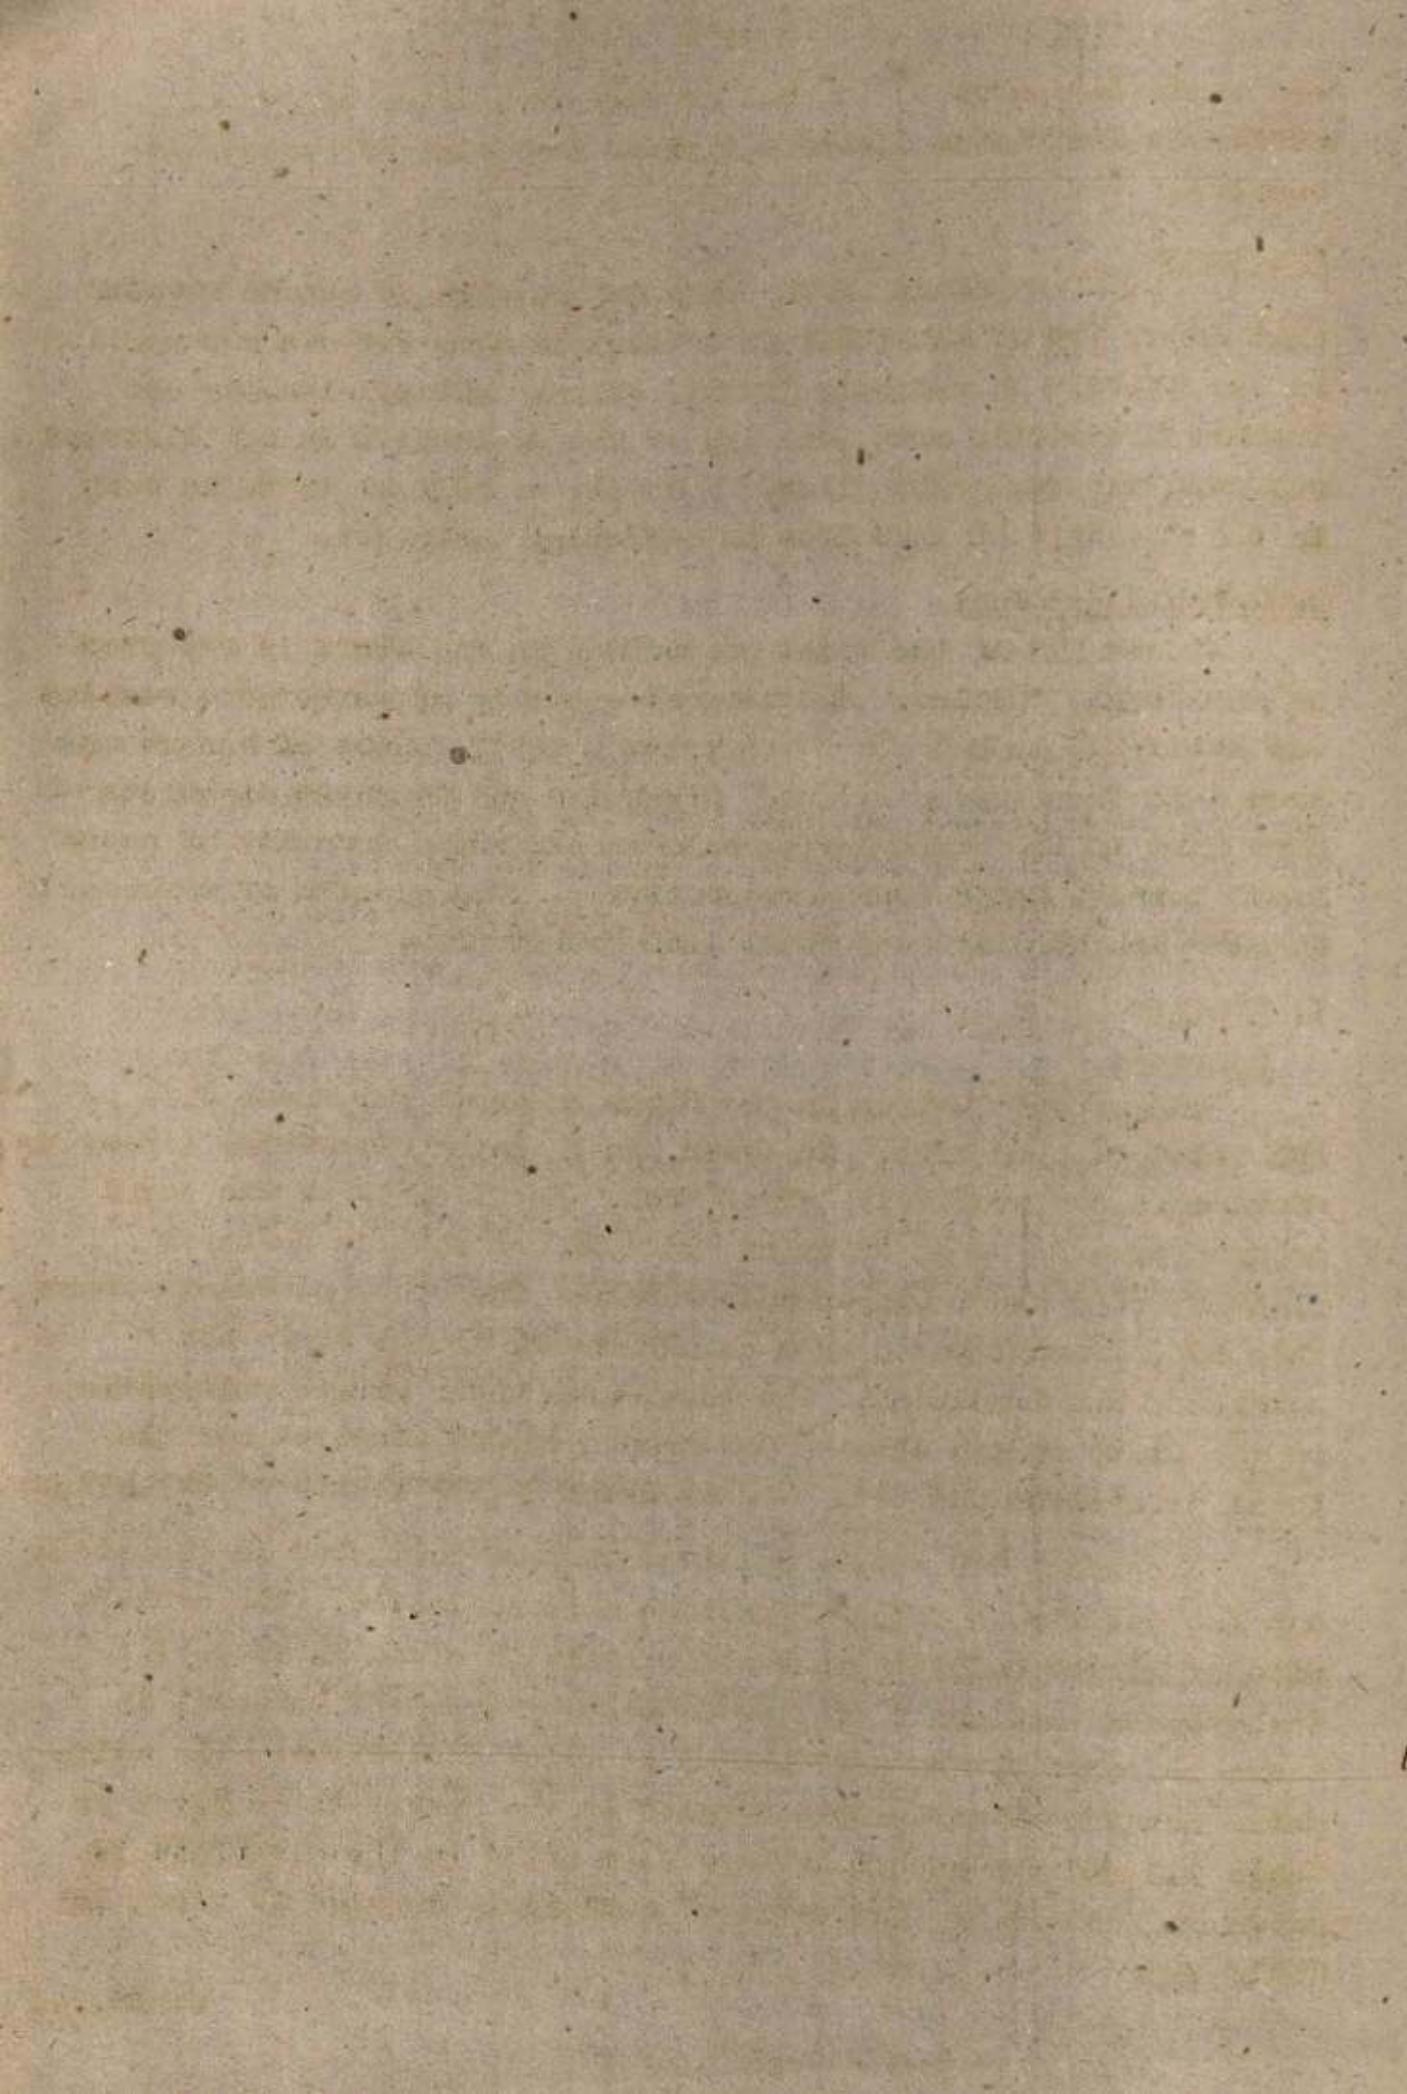

7. Ginger:

General:

Ginger cultivation in the State accounts for about 0.5% of the total cropped area. In Wynad and Kottayam districts, ginger is grown in a comparatively larger area. About 1.65% of the total cropped area in Wynad district and 1.35% of that in Kottayam district come under ginger cultivation. The other districts where this crop is cultivated on a comparatively larger scale are Kozhikode and Ernakulam. The total area under ginger cultivation in the State during 1983-84 was around 15,000 hectares and the total production was estimated at about 36,700 tonnes of dry ginger.

Altogether 118 sample cultivators were contacted in the State and the details on disposal pattern were collected. The average size of ginger holdings in the districts is given in Table 7.1. The disposal pattern of the production by types of disposal is shown in table 7.2 as percentages to total production. The estimated quantum of marketable surplus in the districts is given in Table 7.3 and the annual average farm price in the districts is given in Table 7.4. The value of marketable surplus is given in Table 7.5.

Contd....

Findings:

Next to sales, the main type of disposal of ginger is probably as seed. About 14% of the total production in the State is used as seed. Out of this 5.6% was for sale and 0.4% was for own use. The quantity used for own consumption was negligible being 0.4% only in the State. About 17.7% is seen stored for future sale.

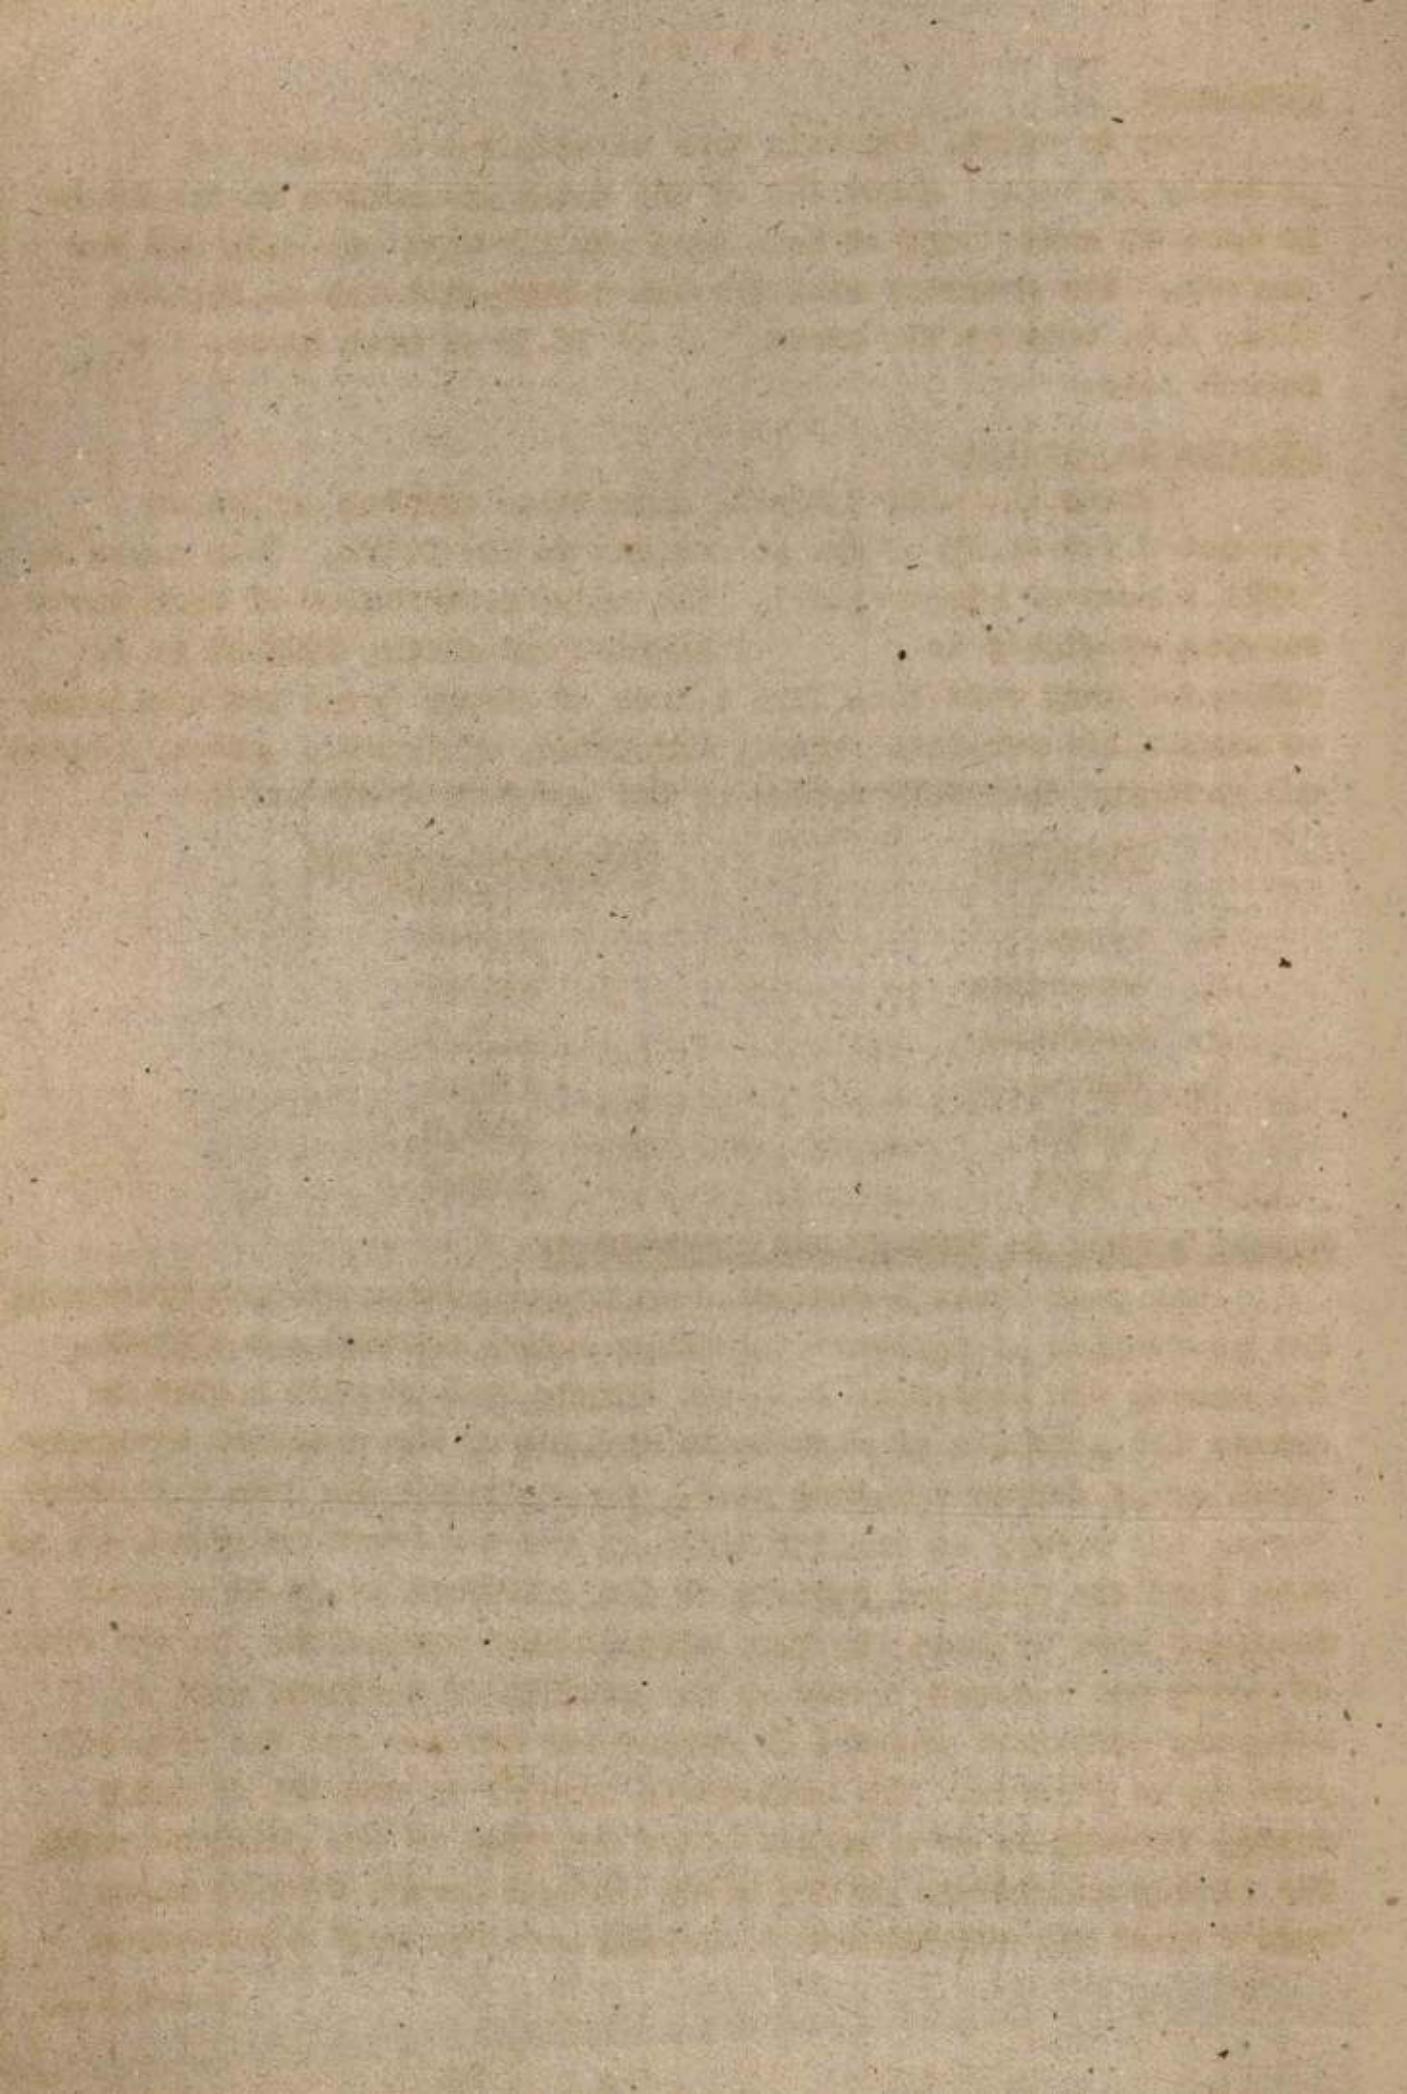

Marketable surplus:

During the year 1983-84, marketable surplus of ginger accounted for 85.4% of the production in the State. This comes to 31342 tonnes of ginger (dry). The major contributor of marketable surplus of ginger is Kozhikode district and during 1983-84 it is estimated that more than 7725 tonnes of ginger (dry) was available as marketable surplus. Wynad, Ernakulam, Cannanore, Quilon, Idukki and Kottayam districts follow in the order as shown below:

<u>District</u>	<u>Marketable surplus (in tonnes)</u>
1. Wynad	5204.0
2. Ernakulam	4392.6
3. Kozhikode	3578.7
4. Cannanore	2787.5
5. Quilon	2586.9
6. Idukki	2585.5

Repeat survey in 1984-85 and conclusion:

The year 1982-83 witnessed an unprecedented drought affecting the production of agricultural crops during 1982-83 and 1983-84. The survey was therefore repeated during 1984-85 with a view to assess the position of marketable surplus of the selected agricultural crops during a normal year. On analysing the data collected during the survey on similar lines as for the previous round, it is seen that the disposal pattern of the different crops in general remained more or less the same without much variation. In the case of paddy and coconut, however, the results of analysis gave a slightly different picture of marketable surplus and the disposal pattern in general. The marketable surplus in respect of paddy during 1984-85 is of a higher order compared to the previous year. The bitter experience of the heavy drought during 1982-83 might have forced the cultivators to retain more for home consumption

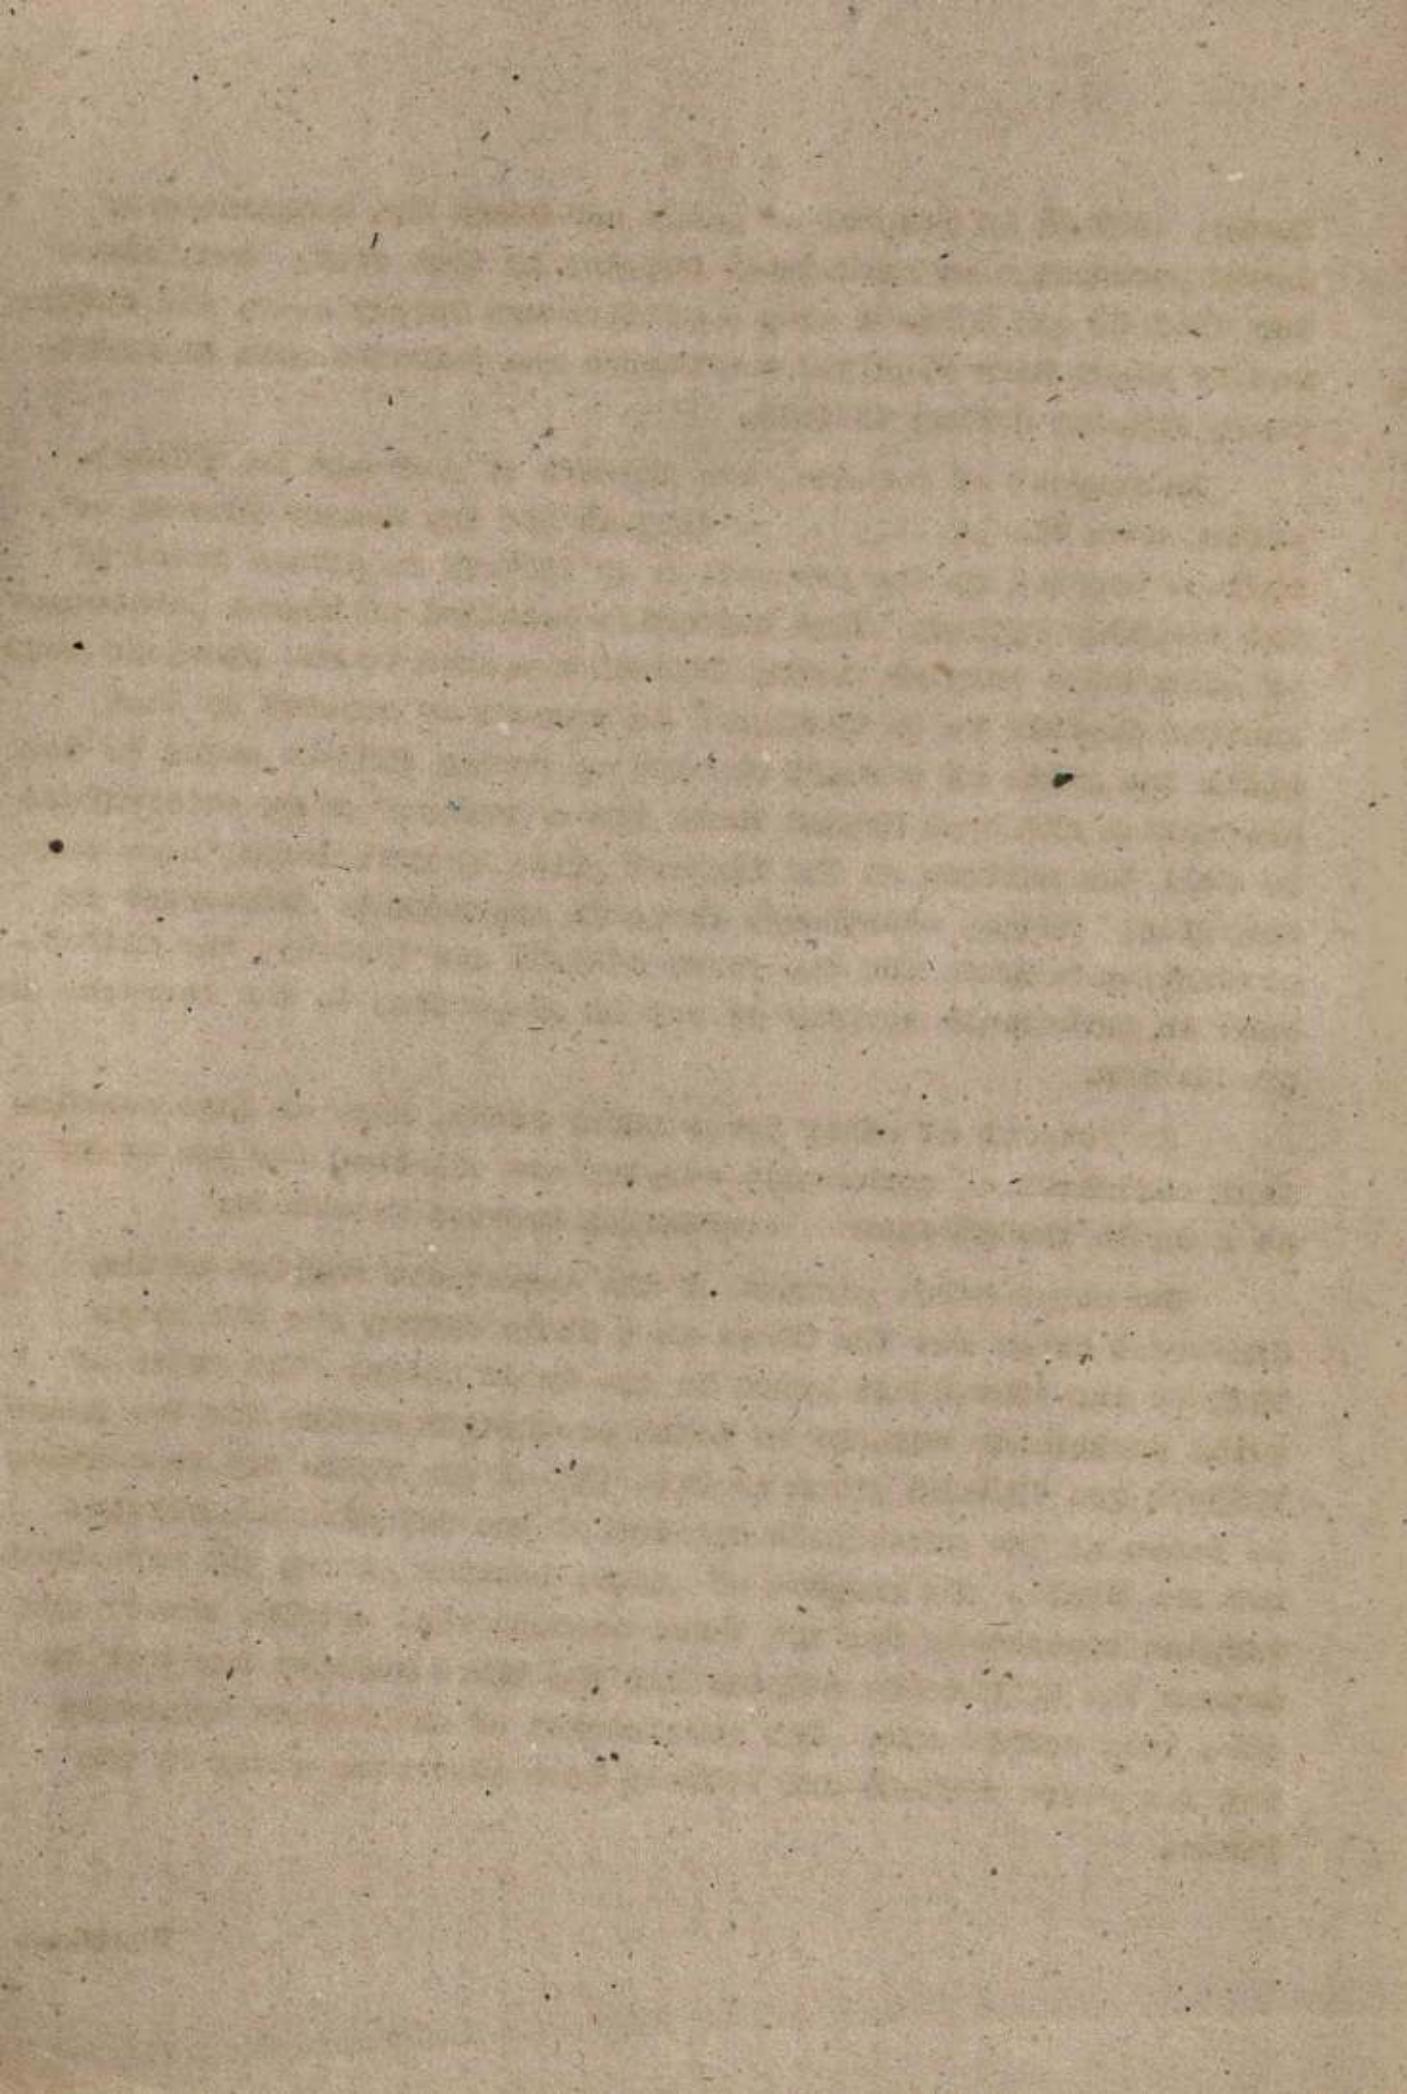

during 1983-84 in respect of paddy and hence the comparatively lower percentage of marketable surplus in that year. But, since the 1983-84 and 1984-85 crop condition was fairly good, the cultivators might have regained confidence and released more as marketable surplus during 1984-85.

In respect of coconut, the failure of monsoons in 1982-83, pulled down the production of 1983-84 and the summer showers of 1983-84 boosted up the production of 1984-85 to normal level if not slightly higher. This naturally resulted in higher percentage of marketable surplus during 1984-85 compared to the previous year. Another feature to be mentioned in respect of coconut is that since the price of coconut shoted up during 1983-84 owing to low production and high demand there was a tendency among cultivators to sell the maximum at the highest price by restricting home consumption. Hence, eventhough there is appreciable difference in production between the two years 1983-84 and 1984-85, the difference in marketable surplus is not in proportion to the increase in production.

In respect of other crops under study, more or less consistent estimates of marketable surplus are obtained for the State as a whole though there is variation between districts.

The comparative picture of the marketable surplus of the different crops for the State as a whole during the two years 1983-84 and 1984-85 is given in the table below: The ratio of total marketable surplus to total production during the two years 1983-84 and 1984-85 given in Col. (5) of the table may reasonably be taken as the marketable surplus of the selected commodities for the State. In respect of paddy, besides giving the marketable surplus separately for the three seasons viz. Autumn, Winter and Summer the marketable surplus for the three seasons together has also been worked out. The percentages of marketable surpluses for the years 1983-84 and 1984-85 have also been given in the table.

Marketable surplus of selected agricultural crops

Sl. No.	Name of crop	Marketable surplus (in percentage)		
		1983-84	1984-85	1983-85
1	2	3	4	5
