**REPORT ON THE CROP CUTTING SURVEY  
KANNI (AUTUMN) CROP OF PADDY 1954  
IN KERALA STATE.**

DES  
LIBRARY

013-184

This Report presents a summary of the results of the Crop Cutting Survey on the September-October crop of paddy. The survey covered all the taluks in the Kerala State and the autumn crop of paddy is harvested.

**SAMPLING DESIGN:**

The design of the survey is one of multi-stage random sampling with stratification. The taluks were taken as the strata and villages the primary unit of sampling. The fields formed the secondary unit of sampling and the square plots formed the last stage of sampling unit. Altogether 300 villagers were selected for the crop cutting survey. The number of villages allotted to each one of the 50 taluks was six. A systematic sample of 5 paddy fields was chosen from each selected village and from each selected paddy field square plot of side  $16\frac{1}{2}$  ft., was selected at random. If the field had more than one kandom, one of the kandoms was selected with probability proportional to area and the square plot was selected from it.

**FIELD WORK:**

The field works were performed by the Investigators and the Statistical Inspectors. Their work was supervised by the District Statistical Officers. Though 1,500 experiments were planned, only 1093 fields were actually available for harvest. The perimeter of the kandom and the average width of the bunds were also measured with a view to arrive at an estimate of the area occupied by bunds. The weight of the green winnowed paddy harvested from the square plot was noted correct to the nearest quarter of a pound. The drriage factor for each taluk was also determined based upon actual drriage experiments.

**ANALYSIS OF THE DATA AND RESULTS:**

The analysis of the data collected was done in the Head Office. The mean yield per acre for each taluk was estimated based upon the actual results of harvest. The area under the crop during the season in each taluk was estimated based upon the Land Utilisation Surveys conducted by this Department. The mean yield for the State was obtained by weighting the taluk mean yields with the corresponding area under the crop in the taluk. The standard error for the mean yields were also worked out in respect of all the taluks. The results of analysis are presented in the accompanying Tables. The total acreage under paddy during the crop was estimated as 9,82,200 acres and the total production was 4,45,500 tons of rice. The weight of rice was taken as 65.7% of the weight of paddy. The mean yield of paddy for the State during this crop was estimated as 1,547 lb. per acre and it has a standard error of 38 lbs. per acre which is about 2.5% of the mean yield.

*Assistant Director-in-charge.*

TABLE 1

## KANNI CROP OF PADDY 1958 IN KERALA STATE

The estimated mean yield per acre and the total out-turn of dry Paddy and Rice in different taluks.

Sl. No.	District and Taluks.	No. of experiments.	Net area harvested	Mean yield of dry paddy (lbs per acres)	Standard error.	Total out-turn dry paddy (Tons).	Total out-turn of Rice (Tons).
