THE CROP CUTTING SURVEY

ON

WINTER AND SUMMER CROP

OF

PADDY

1980

FOREWORD

Crop Estimation Surveys on Paddy are being conducted by this Department regularly from 1950 onwards, separately for each season viz. Autumn (Viruppu), Winter (Mundakan) and Summer (Punja). The results of these Surveys are usually published in two separate reports, one for Autumn and the other for Winter and Summer together. This report deals with the object, area covered by the survey, the sampling technique adopted, the results of the analysis of the data and the reliability of the results obtained from the survey on Winter and Summer Crops of Paddy, 1980.

This report was prepared by the Agricultural Statistics Division of the Directorate of Economics and Statistics.

Trivandrum,

9-5-1983.

K. RAMA VARMA,
Director of Economics and Statistics.

15. 4.4 Frequency distribution of plot yields, summer 1980.
16. 4.5 Result of driage experiments, summer 1980.
17. 4.6 Mean yield of summer season for each taluk for six years from 1975 to 1980.
18. 5.1 Area, mean yield and production of high yielding and other varieties of paddy, summer 1980.
19. 5.2 Area, mean yield and production of high yielding varieties of paddy in each district, summer 1979-80.
20. 5.3 Distribution of experimental plots with high yielding varieties of paddy in each district according to varieties raised, summer 1980.
21. 5.4 Average yield of high yielding varieties, summer 1980.
22. 6.1 Yield rate of high yielding varieties and other varieties of paddy according to cultural practices summer 1980.
23. 7.1 Season-wise area, mean yield and production of high yielding varieties, 1979-80.
24. 7.2 Season-wise area, mean yield and production of all varieties, 1979-80.
25. 7.3 Season-wise area, mean yield and production of high yielding varieties in Kerala from 1976-77 to 1979-80.
26. 7.4 Season-wise area, mean yield and production of all varieties in Kerala from 1971-72 to 1973-80.

REPORT ON CROP CUTTING SURVEY ON WINTER AND SUMMER CROP OF PADDY, 1980

1. Introduction :

The Directorate of Economics and Statistics have been regularly conducting annual crop estimation surveys on two important food crops of the State viz. Paddy and Tapioca. In the case of paddy, the experiments are conducted separately for each of the three seasons namely Autumn, Winter and Summer.

Usually the results of Crop Cutting Surveys on Paddy are prepared and published in two parts; one for Autumn crop and the other for Winter and Summer crops. The report for Autumn crop of paddy has already been published. The present report deals with the results of experiments conducted on winter and summer crops of paddy.

2.1 Objectives of the Survey :

The main objectives of the survey were (1) to estimate the average yield of paddy per hectare for each Taluk, District and the State, (2) to estimate the total production of rice in the State during the season, (3) to estimate the productivity of High Yielding Varieties of Paddy at the District level and (4) to study the cultivation practices of Paddy.

2.2 Period of Survey :

The harvesting period of Winter crop is from December to February and that of Summer crop is from March to May. The field work relating to Winter season was completed in February 1980 and that of Summer in May 1980.

2.3 Coverage and sample size:

The Survey was conducted in all the Taluks where the crop is grown during the respective seasons. During Winter 1980, the Survey covered all the taluks except Cochin. During Summer, the experiments were conducted in 50 out of 57 taluks. The taluks where the experiments were not conducted are, Shertalai, Kanjirappally, Peermade, Devikulam, Udumbanchola, Thodupuzha and Cochin.

2.4 Sampling design :

A Stratified multi-stage random sampling design was adopted for the survey. Taluk was treated as the stratum, revenue village as the first stage unit, a survey sub-division number as the second stage unit, a Kandom as the third stage unit, and a square plot of sides 5 metres as the ultimate sample unit. The number of experiments to be conducted in each season is fixed considering the area of the crop and availability of the Investigators. The total number of experiments to be conducted in a taluk was however limited to 30 in a crop season, subject to a minimum of 2 experiments in a village. The selection of revenue villages was done at the headquarters of the Directorate in the beginning of the agricultural year, they being the same as those selected for the TRS. The number of experiments to be conducted in each investigator unit was fixed by Deputy Director in consultation with the District Statistical Officer and Statistical Inspector. In each of the investigator units, the required number of experimental plots were selected by simple random sampling method from the frame consisting of the list of wet land survey sub-divisions in the unit growing the crop and that would be harvested in the season.

In survey sub-divisions having more than one Kandom, one Kandom was randomly selected and a square plot of side 5 metres was located at random in the selected Kandom. The crop in the square plot was harvested, threshed winnowed and weighed.

Three samples of harvested produce each weighing 250 grams were collected at the time of harvest from a taluk. The first sample was taken at the beginning, the second towards the middle and the third towards the end of the harvesting season in each taluk. The sample collected were sent to the concerned Taluk Statistical Inspectors within 24 hours for conducting driage experiments. The samples were dried and weights taken on alternative days till two consecutive weights were the same.

2.5 Sample selection :

The selection of plots (survey sub-division) in each Investigator unit was done by the Taluk Statistical Inspector. The selection of Kandom, if the number of Kandoms in the selected survey sub-division was more than one and the location of square plot of side 5 metres were done by the Investigators.

The list containing the details of the plots selected for crop cutting experiments were forwarded to the Assistant Director (National Sample Survey Organisation), Trivandrum and also to the District Agricultural Officers for facilitating inspections at harvest stage by their staff.

2.6 Field Work:

The field work of the survey was conducted by the Investigators working in T.R.S. under the immediate supervision of the Taluk Statistical Inspectors. The District Statistical Officers were responsible for the supervision of the field work of the survey. The Additional Statistical Officers attached to the District Statistical Offices also conducted the supervision of the field work of the survey.

The total number of crop cutting experiments planned in the State during Winter and Summer 1980 were 1476 and 1192 respectively. The percentage response was about 98.7% for winter and 90.4% for summer. During the previous year the percentage of response was 98% for Winter and 96% for Summer.

The field work were allotted to 800 Investigators during Summer and Winter. But only 733 Investigators in Winter and 527 investigators in Summer had actually conducted the experiment. It was found that 5 experiments or more were done by 33 Investigators in Winter '80, and 43 Investigators in Summer '80. The average number of experiments per investigator was two in both Winter and Summer '80.

The field work of the survey was inspected at 3 stages by the Statistical Inspectors, District Statistical Officers attached to the District Statistical Offices. Targets had been fixed for the supervising officials for the conduct of inspection at the harvest stage. The Officers at the district level had been instructed to conduct harvest stage inspection at the rate of one experiment in each taluk. The Statistical Inspectors were asked to conduct harvest stage inspections atleast one in an investigator unit subject to a minimum of six experiments in the taluk. 34% of the experiments analysed were inspected at harvest stage during winter'80 and 46% in summer'80. The percentage of pre-harvest stage inspection was about 6% in Winter and 14.7% in Summer season. The post harvest stage inspection conducted was about 3.5% in Winter and 2.9% in Summer '80.

2.7 Analysis:

The Tabulation and analysis of the data collected through the survey was done at the Directorate by the Agricultural Statistics Division.

2.8 Procedure of Estimation:

(i) *Mean yield*—The taluk-wise mean yield of dry paddy and its standard error were estimated using the following formula:—

$$\text{Taluk-Mean yield} = \frac{\sum_{i=1}^K \sum_{j=1}^{n_i} x_{ij}}{\sum_{i=1}^K n_i}$$

Where n_i =number of experiments conducted in the i th village ($i=1, 2, 3, \dots, k$)

K =Number of villages selected in the taluk.

x_{ij} =Weight of paddy obtained from the j th experiment in the i th village ($j=1, 2, 3, \dots, n_i$)

Each experiment is taken from 5 metre square $\frac{1}{400}$ hectare

Mean yield of dry paddy in kg. per hectare= $\bar{X} \times 400 \times d$

Where d is the driage ratio of dry paddy to wet paddy.

(ii) *Standard error of Taluk mean yield*:

Variance of taluk

$$\text{mean yield} = \frac{A}{N} + \frac{B-A}{m} \times \frac{\sum_{i=1}^k n_i^2}{N^2}$$

Where A =Mean square within village.

B =Mean square between village

$$N = \text{Total number of experiments conducted in the taluk} = \left(\sum_{i=1}^K n_i \right)$$

n_i =Number of experiments conducted in the i th village

$$m = N^2 - \frac{\sum_{i=1}^k n_i^2}{\frac{N(N-k)}{k}}$$

k =Number of villages selected in the taluk

The Standard error (SE) is the square root of the variance.

The standard error in kg/Hectare is obtained by multiplying the root of variance with 400.

(iii) *Standard error of the State*:

Mean yield: The formula adopted for the computation of standard error of the State mean yield is indicated below.

$$\text{Standard error of the State Mean Yield} = \sqrt{\frac{\sum (a_i - \bar{s}_i)^2}{(\sum a_i)^2}}$$

Where a_i =Area under the crop in the i th taluk and s_i =the standard error of the estimate of mean yield in the taluk.

The data on area under paddy in each taluk estimated through the TRS have been utilised to compute the production of rice. The weight of clean rice is reckoned as 65.7% dry paddy.

3.1 Result of the survey:

The estimates of production of rice in the state during the different seasons in the year 1979-80 are given below.

Autumn 1979—	567,703 tonnes
Winter 1980—	526,461 "
Summer 1980—	205,531 "
Total	<u>12,99,695 ,,</u>

The production of rice in the State increased considerably during Autumn 1979 by about 23,000 tonnes compared to the previous year. It however decreased by 3500 tonnes during winter season compared to the corresponding season in the previous year. In summer season, the production showed a satisfactory increase. This fall in production in Winter season was mainly due to flood damages, water logging and decrease in the area of cultivation. It is also reported (from certain places) that the cultivators were diffident to apply adequate inputs due to low prices of paddy. The climatic conditions were favourable during Summer and pest attack not acute. As a result, a better yield rate was obtained during Summer. The area under high yielding variety of paddy increased by more than 6,600 hectares and production by 33,600 tonnes in winter though the total area under and production of paddy decreased during the season.

In Summer season however a decrease was noticed in both area and production of high yielding variety. This was mainly due to the fear of cultivators about the heavier incidence of pest attack on high yielding varieties compared to other varieties. The estimated area, mean yield and its standard error, production of rice together with the number of crop-cutting experiments analysed for each taluk during Winter and Summer 1980 are given in table 1.1 and 4.1 respectively of the appendix. Comparison of the yield rates of 1980 with that of the previous year reveals that the productivity has decreased in the districts of Trivandrum, Alleppey, Ernakulam, Malappuram and Kozhikode in Winter 1980 from that of 1979. But in Summer 1980, the productivity was on an increase in 8 districts in the State compared to summer 1979.

The results of I. A. D. P. scheme of experiments conducted at Alleppey and Palghat Districts have not been received.

Usually during summer season crop cutting experiments under I. A. D. P. are not done in Palghat District as the area under summer paddy is comparably small there. In summer season the experiments were conducted in Alleppey, but it was found that the results of the State series and I. A. D. P. series could not be pooled together as the Statistical test of the means turned out to be highly significant.

The analysis of variance of plot yield pooled for the State is given in table 1.3 and 4.3 of the appendix in respect of Winter and Summer seasons respectively. In both cases the yield rate of paddy was found to be statistically significant between taluks.

The frequency distribution of plot yields obtained through the survey in each district as well as the State during Winter and Summer seasons are given in table 1.4 and 4.4 respectively in the appendix using the wet weight of paddy of the experimental plots. The highest yield rate of 4100 kg. of wet paddy per hect. was obtained from 8% of experimental plots in winter and 15% of experimental plots in summer. The lowest yield rate of less than 500 kg. of wet paddy per hect. was obtained from 2.4% of experimental plots in winter and 4% experimental plots in Summer.

In order to determine the driage ratio of dry paddy to wet paddy 168 and 144 driage experiments were conducted in Taluks statistical offices during winter and summer 1980 respectively. The lowest driage ratio was reported from Trivandrum District in both the seasons 0.868 in winter and 0.869 in summer. The highest percentage recovery of dry paddy from wet paddy was recorded in Palghat and Cannanore district (92.7) in summer. The driage ratio for the state was estimated as 90.3% in winter 90.4% in summer respectively.

3.2 High Yielding Varieties:

The estimated area mean yield and production of high yielding variety of paddy in each District and in the State during winter and summer 1980 are presented in table 2.1 and 5.1 respectively in the Appendix. The estimates showed that about 25% of paddy area in winter and 52% in summer 1980 was brought under high yielding varieties.

A comparative picture in respect of area mean yield and production of high yielding varieties in the different districts and State in Winter and Summer seasons of 1979-80 is provided in table 2.2 and 5.2 respectively.

The area under High Yielding Varieties increased by 8.6% in winter compared to the previous winter, the trend being accounted by 6 out of 11 Districts. But in Summer the area decreased slightly by 2.3% in the State. In the Districts of Kozhikode, Ernakulam, Kottayam, Alleppey and Trivandrum the decrease is seen.

The productivity in Winter was higher in 7 Districts as compared to previous year. The reverse trend was found only in Trivandrum, Alleppey, Kottayam and Malappuram districts. The districts of Trivandrum, Alleppey, Kottayam and Kozhikode together accounted for the fall in productivity in Summer 1980 over the previous year. The production of rice from the high yielding variety of paddy in the State increased by about 25% in winter and came down by 6.8% in summer 1980 from the level of production in the previous year.

The distribution of experimental plots with high yielding varieties of paddy according to the varieties raised in each district and the State, during Winter and Summer 1980 are given in table 2.3 and 5.3 respectively in Appendix. It is found that 19.2% and 54.5% of the experimental plots were under high yielding variety during Winter and Summer respectively. From this table it can be seen that the cultivators prefer Jyothi, Thriveni, Annapurna and Jaya in summer and Jyothi, H 4 and Mashoori in winter seasons. In almost all the districts Thriveni and Jaya varieties are raised in both seasons. Other newly introduced strains are not so popular.

The estimates of average yield (simple average) of various high yielding varieties at the District and the State level are presented in table 2.4 and 5.4 for Winter and Summer seasons respectively in the appendix. The highest average yield of 4873 kg. per hectare in winter was obtained by IR-20 in Idukki District and 5278 kg. per hectare in summer by H4 in Kozhikode district respectively. The names of high yielding varieties which correspond to the highest average yield in each district together with the highest average yield and the number of experimental plots where the crop was raised in each District during winter 1980 and summer 1980 are indicated in the table below:

TABLE 1

District-wise high yielding varieties with highest average yield—Winter 1980

Sl. No.	District	H.Y.V. correspond to highest average yield	Highest average yield (dry paddy kg./hect.)	No. of experimental plots where H.Y.V. given in col. (3) raised.
(1)	(2)	(3)	(4)	(5)
1	Trivandrum	H4	3123	3
2	Quilon	Culture 28	3115	13
3	Alleppey	Jyothi	3253	33
4	Kottayam	Bharathy	3051	51
5	Idukki	IR-20	4873	20
6	Ernakulam	H4	3083	15
7	Trichur	Jaya	3127	26
8	Palghat	Jaya	3942	73
9	Malappuram	Bharathy	4459	22
10	Kozhikode	H-4	3818	5
11	Cannanore	Sabari	3872	19

H-4 variety recorded highest average yield in three districts in winter 1980, while Jaya and Bharathy in two districts IR-20 recorded the highest yield rate among the different varieties. Jaya, Jyothi and Bharathy are found to be the most widely adopted high yielding variety during the season.

TABLE 2

District-wise H. Y. V. with highest average yield—Summer 1980

Sl. No.	District	H.Y.V. correspond to highest average yield	Highest average yield (dry paddy kg./hect.)	No. of experimental plots where H.Y.V. given in col. (3) raised
(1)	(2)	(3)	(4)	(5)
1	Trivandrum	Sabari	2575	54
2	Quilon	Culture-28	1460	35
3	Alleppey	Culture-28	4540	92
4	Kottayam	Jyothi	3900	27
5	Idukki	IR-8	4054	..
6	Ernakulam	Bharathy	4084	60
7	Trichur	Jyothi	3532	77
8	Palghat	Jyothi	3955	65
9	Malappuram	H-4	5278	46
10	Kozhikode	Pankaj	3222	80

H-4 recorded the highest average yield in the State during Summer 1980 in Kozhikode district. In Kottayam, Palghat and Malappuram districts, Jyothi recorded the highest average yield. Culture-28 recorded the highest average yield in Alleppey district.

3.3 Cultivation Practices :

It was found that about 33% and 78% of the experimental plots received irrigation during Winter and Summer 1980 respectively. These percentages were 38 and 79 respectively during the corresponding seasons of the previous year. About 85% of the irrigated plots were found to have applied with chemical fertilisers in winter 1980 while in summer this percentage was found to be 88.4. In winter 1980, another 13% of the irrigated plots were reported to have applied 'other manure' only like farm yard manure, green manure etc. This type of manure was also applied to about 10% of the experimental plots in summer 1980. As far as irrigated plots were concerned, about 71% of them were found to have received chemical fertilisers and manure, green manure, compost manure, etc. during winter 1980. In summer 1980 the corresponding percentages are 86 and 1.2 respectively. About 5 per cent of the irrigated plots covered by the survey were reported unmanured in winter and 2 per cent in summer 1980.

It was reported that crops in about 43% of the experimental plots in winter and 70% in summer were treated with insecticides and pesticides.

In the case of experimental plots where high yielding varieties were raised it was found 54% and 87% of them in winter season and summer 1980 received irrigation. About 95% of the irrigated plots under high yielding varieties in winter and summer 1980 were brought under chemical fertilisers.

Insecticides and pesticides were applied to about 70% and 81% of the experimental plots under high yielding varieties in winter and summer 1980 respectively.

The estimate of average yield of high yielding and other varieties of paddy is given in table 3.1 and 6.1 respectively for Winter and Summer 1980.

The estimated area, mean yield and production of high yielding varieties of paddy in each district during the three seasons viz. Autumn, Winter and Summer 1979-80 are given in table 7.1 in the Appendix to facilitate comparison. A similar statement for all varieties of paddy is given in table 7.2 in Appendix. The estimated area, mean yield and production of high yielding varieties of paddy in the State for the last 4 years from 1976-77 are given separately for each season in table 7.3 in the appendix. A similar statement for all varieties of paddy for the last 9 years from 1971-72 are given in table 7.4 in the Appendix.

APPENDIX

TABLE 1.1

Estimated area, mean yield and production of rice in each taluk—Winter 1980

TABLE 7.1
Season-wise area, mean yield and production of high yielding varieties of paddy during 1979-80

TABLE 7.2
Season-wise area, mean yield and production of rice in each district during 1979-80

TABLE 7.3
Season-wise area, mean yield and production of high yield varieties of rice in Kerala during the period from 1976-80

Agricultural year	Autumn		Winter		Summer		Total			
	Area in hect.	Mean yield of dry paddy (kg/hect.)	Area in hect.	Mean yield of dry paddy (kg/hect.)	Area in tons	Production of dry paddy (kg/hect.)	Area in hect.	Mean yield of dry paddy (kg/hect.)	Area in tons	Production of dry paddy (kg/hect.)
