## FOR E W O R D

The present report "Consolidated results of Crop Estimation Surveys 1976-77" is prepared as the State counterpart of the All India Report on the subject and as recommended by the conference of the State Statisticians in charge of crop estimation surveys. This report gives brief descriptions on the methodology and conduct of the crop cutting surveys on Paddy, Tapioca, Coconut, Cashew, Pepper and Areca nut conducted during 1976-77 in the State by the Bureau of Economics and Statistics.

The important results of the survey including the estimated mean yield of paddy and the production of rice during each of the three paddy seasons viz. Autumn, Winter and Summer in each district and the State are given in Table 1 to 7 in the Appendix. The results of the crop cutting surveys conducted on other crops are given in Table 8 to 17 in the Appendix.

# CONSOLIDATED RESULTS OF CROP ESTIMATION SURVEYS

1976—1977

## **1. Introduction:**

Crop estimation surveys on paddy and tapioca were being conducted in the State by the Bureau of Economics and Statistics. In the agricultural year 1976-77, (the 2nd year of introduction of T.R.S. in the State), the crop estimation surveys were extended to four more important crops viz. coconut, cashew, pepper and arecanut in the State. This report gives a brief review of the crop estimation surveys conducted during 1976-77. The salient features of these surveys are described in this report in a comprehensive manner. The important findings of the surveys such as yield rates, total outturn of produce, area under H.Y.V. of paddy; yield rates of irrigated and unirrigated paddy plots etc. are presented in the tables appended to this report.

## **2. Objective, Coverage and Design:**

The primary object of these surveys is to obtain through crop cutting experiments estimates of average yield per hectare for paddy at the taluk level and for other crops at the district level with reasonable precision and to estimate the average yield and total outturn of these crops in the State.

But experiments for a crop is limited to the taluks where the area of that crop is sizable. The number of taluks where the survey was conducted for each crop is listed in the Table given below:—

**TABLE—1**

Sl. No.	Crop	No. of taluks where the survey was done
(1)	(2)	(3)
1	Paddy	
	a. Autumn	52
	b. Winter	54
	c. Summer	49
2	Tapioca	48
3	Coconut	52
4	Cashew	40
5	Pepper	37
6	Arecanut	42

A crop cutting experiment consists of locating and marking of plot of specified size in the case of paddy and tapioca or locating and marking of trees in the case of other crops by the principle of random sampling in a randomly selected field and harvesting and recording the weight or number of produce obtained from the experimental plot or trees. In the case of paddy in a sub samples of experiments further processing of the harvested produce is done for determining the percentage recovery of dry grain. The designs adopted for the surveys conducted on various crops are discussed below:

### **2.1 Paddy:**

A stratified multistage random sampling design is adopted for the survey. Each taluk was treated as the stratum, revenue village as the first stage unit a survey subdivision number as the second stage unit, a kandom as the third stage unit and a square plot of side 5 metres as the ultimate sampling unit. In the case of survey subdivision numbers having more than one kandam/patch, one kandom will be selected and in that kandom a square plot of side 5 metres will be located. The produce of the plot is harvested, threshed and winnowed and the weight of the grain is recorded. Driage ratio is determined by processing sample grains taken from a sub sample of plots harvested.

The number of experiments to be conducted in a taluk is fixed as two experiments per investigator unit in those taluks where there are more than seven investigator units and three experiments per investigator unit in the case of other taluks.

Crop cutting surveys on paddy are conducted separately during each of the three seasons viz. Autumn, Winter and Summer, in the same revenue villages selected under T.R.S. in every taluk.

### **2.2 Tapioca:**

The survey on Tapioca is conducted in 48 taluks where the crop is raised during the year. The villages selected for this purpose are the same villages selected under T.R.S. in the taluks where the survey was conducted.

From the list of dry land survey subdivision numbers allotted to each Investigator, five dry land survey subdivision numbers are selected by simple random sampling method and the Investigator visits these plots in the order of selection for getting 2 suitable plots where crop cutting experiment on Tapioca can be conducted. It is essential that in each selected plot there should be a minimum area of  $2 \times 2$  metres under Tapioca in one patch. If a selected plot contains more than one patch under Tapioca, satisfying the above requirements, then one patch is selected by simple random sampling method for conducting the experiments.

If the required number of cuts are not obtained from among the first five plots selected, either due to the nonavailability of the crop or due to the unsuitability of conducting crop cutting experiments, another set of five dry land subdivision numbers are selected as before to get the required number of experiments. If necessary, this process is repeated until the plots suitable for conducting the experiment are obtained or all the dry land plots in the unit are exhausted.

In the selected plot a square cut of 2 x 2 metres is selected at random for conducting the experiment. All the Tapioca plants inside the 2x2 metre square are harvested. The produce are cleaned by removing the soil sticking to the tubers and then weighed.

### 2.3 Coconut:

The crop cutting survey on coconut is conducted in all the taluks in the State except in five taluks in the high ranges (Peermadu, Devikulam, Udumbanchola, South Wynad and North Wynad). The villages selected for this purpose are the same villages selected for T.R.S. in those 52 taluks.

One coconut growing plot is selected by simple random sampling method from the list of dry land subdivisions in each Investigator Unit. From each plot selected, five bearing coconut trees are randomly selected for conducting crop cutting experiments. For this purpose the bearing coconut trees in the selected plots are serially numbered starting from the south west corner and proceeding anti clock-wise.

After the selection of trees, the Investigator collects the details of all nuts harvested from the selected trees in each harvest during the agricultural year 1976-77 and record the details in the prescribed form.

### 2.4. Cashew, Pepper and Arecanut:

In the case of crop cutting survey on cashew, pepper and arecanut the procedure for selection of plots and trees (or standards in the case of pepper) is the same as that followed for the crop cutting survey on coconut.

### 3. Sample size:

The total number of experiments planned for the survey on paddy during 1976-77 according to seasons are indicated below:

TABLE—2

### Number of experiments planned for paddy 1976-77

Sl. No.	No. of experiments planned	
1	2	3
1.	Autumn 1976	1253
2.	Winter 1977	1200
3.	Summer 1977	1014
	Total	3467

Compared to the number of experiments planned in the previous years, that during 1976-77 was more by 700 in the State for the 3 seasons taken together. The district-wise break up of the total number of experiments planned for the crop cutting survey on paddy in the year 1976-77 is given in Table 1 in the Appendix.

The total number of experiments planned in the State in the case of Tapioca, Coconut, Cashew, Pepper and Areca nut together with their district-wise break up is given in the subjoined table.

TABLE—3  
No. of experiments planned—1976-77

Sl. No.	District	No. of experiments planned				
		Tapioca	Coconut	Cashew	Pepper	Areca nut
1	2	3	4	5	6	7
1.	Trivandrum	71	40	40	30	40
2.	Quilon	114	57	57	50	57
3.	Alleppey	48	49	37	24	37
4.	Kottayam	88	44	21	35	44
5.	Idukki	18	9	9	9	9
6.	Ernakulam	94	49	33	39	41
7.	Trichur	104	55	43	43	43
8.	Palghat	120	60	29	29	29
9.	Malappuram	108	54	54	51	54
10.	Kozhikode	82	41	41	41	41
11.	Cannanore	125	76	78	63	47
STATE		972	534	442	414	442

#### 4. Field work:

The field work of the surveys comprising of selection of fields, identification of selected fields, location and marking of cuts or trees for crop cutting experiments, recording the weight (number of nuts) of the harvested produce is carried out by the field staff of the Bureau of Economics and Statistics. The field work relating to the surveys is attended to by the Investigators under the supervision of the Taluk Statistical Inspectors and District Statistical Officers. During the year under review, 575 Investigators attached to the T.R.S have attended to the field work for the crop cutting survey on these 6 crops.

The planning of the survey, quality check of the work of the field staff and the statistical analysis of the data collected are done at the Directorate of the Bureau of Economics and Statistics.

## 5. Training:

Training classes were conducted at the district headquarters to impart training to all the Investigators engaged in the conduct of crop cutting surveys on the crops under reference. Officers from the headquarters of the Bureau also participated in the training programme.

## 6. Response:

The number of experiments planned, analysed and the percentage response in respect of paddy during the three seasons in each district are given in table 2 in the Appendix. Similar information relating to Tapioca, Coconut, Cashew, Pepper and Areca nut is given in Table 8, 10, 12, 14 and 16 respectively in the Appendix.

## 7. Supervision:

The supervision of the field work is done by the Taluk Statistical Inspectors and District Statistical Officers, Additional District Statistical Officers and Economic Investigators. A fixed programme for inspection at the harvest stage in the case of crop cutting experiments on paddy and tapioca has been arranged. According to which all Inspecting Officers at the district level have to conduct harvest stage inspections at the rate of one experiment in each taluk in the case of paddy while the Taluk Statistical Inspectors have to inspect one randomly selected experiment in each Investigator unit subject to minimum of six experiment in a taluk in each season. As far as tapioca is concerned, the district level officers have to conduct inspections at the rate of 3 experiments in a district while the Taluk Statistical Inspectors have to inspect 5 experiments or 50% of the experiments planned in the taluk, whichever is less. Over and above this, inspection at pre-harvest and post-harvest stages have also been done by the Statistical Inspectors and District Statistical Officers.

Number of crop cutting experiments on paddy inspected at the 3 stages in each of the three seasons during 1976-77 in the State are indicated below in percentages:

TABLE—4  
CROP CUTTING SURVEY ON PADDY  
Number of experiments inspected (in percentage)

Sl. No.	Season 1 2	Harvest stage 3	Pre-harvest stage 4	Post-harvest stage 5
1	Autumn 1976	38.7	18.1	2.1
2	Winter 1977	40.8	14.1	3.0
3	Summer 1977	35.3	11.2	3.3

Independent estimates of average yield of paddy based on experiments inspected at harvest stage are given in Table 3 in the Appendix.

### 8. Results:

The estimated mean yield of paddy together with percentage sampling error and the total production of rice during the three seasons of 1976-77 are given in Table 4 in the Appendix.

Usually the result of the State series of experiments and I A D P series of experiments conducted on paddy crop in Alleppey and Palghat districts are pooled for framing combined estimates. But the results of these two series of experiments are found to be not poolable in all the three seasons in Alleppey district and two seasons in Palghat district during the year as the statistical test for non significance of means turned out to be highly significant. In summer season I A D P series of experiments are not conducted in Palghat district. The yield rates and the production of rice obtained through two series of experiments are given in Table 5 in the Appendix.

The results of experiments conducted for ascertaining the percentage recovery of dry paddy (dry grain) from the wet harvested produce are given in Table 6 in the Appendix. The mean yield of dry paddy per hectare estimated for irrigated and unirrigated areas in respect of each district and the State are also given in this table.

The weight of cleaned rice is reckoned as 65.7% of dry paddy.

The Statement showing the percentage of area under different improved agricultural practices during each of the three paddy crop seasons are given in Table 7.1, 7.2, and 7.3 in the Appendix.

The estimated yield rate and the total production of raw tapioca in each district and in the State are presented in Table 9 in the Appendix. Similar statements for coconut, cashew, pepper and arecanut are given in Tables, 11, 13, 15 and 17 in the Appendix.
