FOREWORD

This report on the consolidated results of crop estimation surveys relates to the period 1978-79 to 1980-81. The methodology employed in crop cutting experiments on major crops viz. Paddy, Tapioca, Coconuts, Arecanut, Cashew and Pepper and minor crops selected for the years are briefly described in this. Four minor crops are selected each year and during the period under review the crops taken up for crop cutting experiments were Mango, Ginger, Turmeric and Sweet Potatoe in 1978-79, Tamarind, Pulses, Groundnut and Cotton in 1979-80 and Cocoa, Pappaya, Lemongrass and Cardamom during 1980-81.

The report was prepared by the Agricultural Statistics Division of the Directorate.

Trivandrum,
14-10-1983.

K. RAMAVARMA,
Director,
Directorate of Economics and Statistics.

CONSOLIDATED RESULTS OF CROP ESTIMATION SURVEYS 1978-81

1. Introduction :

Crop estimation survey on paddy and tapioca were being conducted regularly in the state even before the introduction of the scheme of Establishment of an Agency for reporting Crop Statistics in Kerala. During 1976-77, these surveys were extended to four other important crops viz, Coconut, Areca nut, Cashew and Pepper and they were being conducted on a regular basis. From 1977-78 onwards, crop cutting experiments on minor crops were being conducted, covering four crops during each year. This report gives a brief review of the crop estimation surveys conducted during 1978-79, 1979-80 and 1980-81.

2. Objective, Coverage and Design :

Objective.—The primary object of the surveys was to obtain through crop cutting experiments estimates of average yield per hectare of paddy at the taluk level and of other crops at the district level with reasonable precision and to estimate the outturn of these crops in the state.

Coverage —The experiment for a crop was limited to the taluk where the area of the crop was sizable. Number of taluks where the surveys were planned and the number where they were actually conducted for the years 1978-79, 1979-80, 1980-81 is given in the Table I appended.

TABLE—I

Crop	1978-79		1979-80		1980-81	
	Planned	Conducted	Planned	Conducted	Planned	Conducted
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1. Paddy

7. Mango	57	56	—	—	—	—
8. Ginger	15	15	—	—	—	—
9. Turmeric	16	16	—	—	—	—
10. Sweet-potatoe	10	10	—	—	—	—
11. Tamarind	—	—	33	31	—	—
12. Pulses	—	—	30	—	—	—
13. Grountnut	—	—	1	1	—	—
14. Cotton	—	—	1	1	—	—
15. Cocoa	—	—	—	—	24	23
16. Pappaya	—	—	—	—	44	44
17. Lemongrass	—	—	—	—	7	6
18. Cardamom	—	—	—	—	7	7

Design:—The crop cutting experiment starts with locating and marking of plot of specified size in the case of paddy, tapioca, ginger, turmeric, sweet-potatoe, pulses, groundnut, cotton, lemongrass and cardamom or locating and marking of trees/standards/plants in the case of other crops using random sampling method. The produce at harvest are weighed or counted as the case may be and recorded in the prescribed proforma together with other relevant details.

2.1. *Paddy.*—A stratified multi stage random sampling design is adopted for the survey. Crop cutting experiments on paddy are conducted separately during each season viz. Autumn, winter and summer in the villages selected for T.R.S. in each Taluk. The taluk is treated as stratum, revenue village as first stage unit, survey subdivision number as the second stage unit, and square plot of side 5 metres as the ultimate sampling unit. The produce of the plot was harvested, threshed, winnowed and weight of produce taken. Driage ratio was determined by processing sample grains taken from a sub sample plot.

2.2. *Tapioca.*—The required number of plots are selected from the list of wet & dry plots. The plots are visited to ascertain its suitability for conducting the experiment. If the plot is not suitable for conducting the experiment, next plot is visited till a suitable plot is found. If the selected plot contains more than one patch then one patch is selected by random sampling method. An area of 2×2 sq. metres is fixed for conducting the

experiment. All tapioca plants inside the square plot was harvested. The produce were cleaned by removing the soil sticking to the tuber and then weight of the produce recorded.

2.3. Ginger, turmeric, sweet potatoe, pulses, groundnut, cotton lemongrass and Cardamom.—The required number of plots were selected from the list of dryland plots in the case of ginger, turmeric, groundnut, cotton, lemongrass and cardamom and in the case of sweet potatoe and pulses the selection of plots was done from the list of wet and dry plots. As in the case of other crops, suitable plot was selected proceeding by the order of plots in the list used for selection. Except for groundnut and cardamom, the selected plots were of size 2 x 2m. A 5x5 m square plot was selected for groundnut and a 10 x 10m. squares plot for cardamom.

The produce in the selected plot was harvested, the cleaned produce weighed and weight recorded.

2.4. Coconut, Arecanut, Cashew, Pepper, Mango, Tamarind, Cocoa and pappaya.—From the list of dry land plots the required number of plots for each crop is selected by simple random method. The plots are visited to ascertain its suitability for conducting the experiment ie. to see whether it contains the required number of trees/standards. If it is not suitable, the next plot is visited in succession till a suitable plot is obtained. From each selected plot the required number of bearing trees/standards are randomly selected for the experiment. For coconut arecanut, cashew, pepper and cocoa, five trees are selected and for Mango, Tamarind & Pappaya, two trees. The details of produce harvested are recorded in the prescribed proforma.

3. Sample size :

The total number of crop cutting experiments planned during the years on 1978-79, 1979-80 and 1980-81 are given below.

Crop	Year		
	(1)	(2)	(3)
1. Paddy	Autumn	1404	1491
	Winter	1427	1476
	Summer	1148	1192
2. Tapioca		1224	1245
3. Coconut		514	518
4. Arecanut		415	400
5. Cashew		394	390
6. Pepper		381	394
7. Mango		255	..

(1)	(2)	(3)	(4)
8. Ginger	200
9. Turmeric	210
10. Sweet Potatoe	190
11. Tamarind	..	220	..
12. Pulses	..	210	..
13. Groundnut	..	30	..
14. Cotton	..	30	..
15. Cocoa	220
16. Pappaya	220
17. Lemongrass	68
18. Cardamom	69

4. Field work :

The field work of the surveys comprising of selection of fields, identification of selected field, location and marking of plot or trees for the experiments, recording the weight (number of nuts) of the harvested produce was done by the investigators of the department, under the supervision of the Taluk Statistical Inspectors and District level Officers.

The planning of the survey, and the statistical analysis of the data collected were done at the Directorate. The quality check of the work of the field staff and tabulation in respect of the survey on paddy were done, by the Deputy Director, Regional Tabulation Centres.

5. Training :

Training classes were conducted both at regional level and district level. Training was imparted at regional level to the supervisors and at district level to all the Investigators engaged in the primary work of the survey Officers from the head quarters and from National sample survey organisation also participated in the training.

6. Response :

The number of experiments, planned analysed and the percentage response in respect of paddy during the three seasons in each district is given in tables 1.1, 1.2 and 1.3 in the appendix. Details regarding number of experiments planned, analysed and mean yield per hectare relating to all crops for the three years 1978-79, 1979-80 and 1980-81 are given in tables 7 to 24.

7. Supervision :

The field work of the investigators were supervised by the Statistical Inspectors at taluk level. District level officers and Regional officers also conducted inspections. All inspecting officers at

district level had to conduct harvest stage inspections at the rate of one experiment in each taluk in the case of paddy while the taluk level supervisors had to supervise one randomly selected experiment in each investigator unit subject to a minimum of six experiments in a taluk in each season. As far as tapioca is concerned the district level officers had to conduct inspections at the rate of 3 experiments in a district while the taluk Statistical Inspectors had to inspect 5 experiments or 50% of the experiments planned in a taluk, whichever is less. Over and above this, inspections at preharvest and post harvest stages were done by the Statistical Inspectors and District Statistical Officers.

Independent estimates of average yield of paddy based on the experiments inspected at harvest stage are furnished in table 2 in the appendix.

8. Results :

The estimated meanyield of dry paddy, the percentage sampling error and the total production of rice during the three seasons for the year 1978-79, 1979-80 and 1980-81 are given in tables 3.1 to 3.4 in the appendix.

During the year 1978-79, crop cutting experiments were not conducted in I.A.D.P. series during Autumn 1978 in Alleppey district and Summer 1979 in Palghat district. During the other seasons, crop cutting experiments were conducted in I.A.D.P. series at Palghat & Alleppey. But the results of the state series and I.A.D.P. series in the district were found to be not poolable as the statistical test of significance of means turned out to be highly significant. During the year 1979-80, crop cutting experiments in I.A.D.P. series were conducted only in Alleppey district during Autumn 1979. I.A.D.P. series of experiments has been discontinued from winter 80 onwards.

The yield rates and the production of rice obtained through the two series of experiments during 1978-79 and 1979-80 are given in Table 4.1 and 4.2 in the Appendix. The results of experiments conducted for ascertaining the percentage recovery of dry paddy from harvested produce for 1978-79, 1979-80 and 1980-81 are given in Table 5 in Appendix. The weight of cleaned rice is reckoned as 65.7% of dry paddy.

The statement showing the percentage area under different agricultural practices during the three paddy crop seasons during 1978-79, 1979-80 and 1980-81 as obtained from the experimental plots are given in tables 6.11 to 6.33 in the Appendix. The estimated meanyield rates and the total production of raw tapioca in each district and the state for 1978-79 to 1980-81 are presented in table 7 in the Appendix. Similar statements for Coconut, Arecanut, Cashew, pepper, Sweet potatoe, Ginger, Turmeric Mango, Tamarind, Cotton, Groundnut, Horsegam, Cardamom, Lemengrass, Cocoe and Pappaya are given in the tables 8 to 23 in the Appendix.
