## FOREWORD

This report of "Consolidated Results of Crop Estimation Surveys on Paddy and Tapioca—1974-75" is prepared on the basis of the recommendations made in the conference of the State Statisticians in charge of Crop Estimation Surveys, to fall in line with the reports published at the All India level. The report deals with brief descriptions of the crop cutting surveys on paddy and tapioca, the most important food crops cultivated in the State, conducted during 1974-75, by the Bureau of Economics and Statistics.

The important results of the survey including the estimated mean yield of paddy and the production of rice during each of the three paddy seasons, viz. Autumn, Winter, and Summer, in each district and the State are given in tables 1 to 6. The results of the crop cutting survey on tapioca conducted during the year 1974-75 are given in tables 7 and 8.

# CONSOLIDATED RESULTS OF CROP ESTIMATION SURVEYS ON PADDY AND TAPIOCA 1974-75

## 1. Introduction

This is a brief review of the crop estimation surveys on paddy and tapioca conducted in Kerala State, by the Bureau of Economics and Statistics during 1974-75. The salient features of these surveys are described in the report in a comprehensive manner. In Kerala crop cutting surveys are conducted only on two seasonal crops, viz., paddy and tapioca as they are the most important food crops cultivated in the State. The important findings of the surveys such as yield estimates of rice and tapioca, area under high yielding variety of paddy, yield rates of irrigated and unirrigated plots of paddy etc. are presented in the tables appended to this report.

## 2. Objective, Coverage and Design

The primary object of these surveys is to obtain, through crop cutting experiments, precise estimates of average yield per hectare of paddy at the taluk level and tapioca at the district level and to estimate the average yield and total out-turn of the crops for the State.

Though the surveys cover all the eleven districts in the State, it is limited to the taluks where the crop is actually raised during each season, as far as paddy is concerned.

A stratified multi-stage random sampling design is adopted for the crop cutting survey on paddy. The taluk is treated as a stratum and within each taluk, villages are selected as the first stage sampling units. In each selected village, survey subdivision numbers are selected to form second stage units and within each survey subdivision number, a square plot of side 5 metres is selected as the ultimate sampling unit. In the case of survey subdivision numbers having more than one kandom/patch, one kandam will be selected and only in that kandom the square plot of side 5 metres will be located. The produce of the plot is harvested threshed and winnowed and the weight of the wet grain is recorded. Driage ratio is determined by processing sample grains taken from a sub sample of the plots harvested.

Crop cutting surveys on paddy are conducted separately during each of the three seasons, viz., Autumn (Virippu), Winter (Mundakan) and Summer (Punja). In the case of tapioca, the survey is conducted only once in an year.

Regarding the conduct of crop cutting survey on paddy, six villages are chosen in each stratum (taluk) by simple random sampling method and from each selected village, a sample of three plots is selected by systematic sampling method. Thus normally in a taluk eighteen experiments are conducted during each crop season. But during Summer 1975, two villages are additionally selected in Kuttanad Taluk to provide adequate representation to the paddy fields in the kayal area.

As far as tapioca is concerned the survey is conducted in all the taluks where the crop is raised during the year under review. Five census villages where tapioca is raised on a large scale are selected from the list of census villages selected for the first round of land utilisation survey (L. U. S.) 1974-75. The number of crop cutting experiments to be conducted in each of these 5 villages is fixed as three so that the total number of experiments to be conducted in a taluk is 15. In each of the selected village, from a list of plots (both dry and wet) selected for the land utilisation survey, three plots are selected by simple random sampling method. If any one of these plots is not cultivated with tapioca, another plot is selected so as to make up the number of experiments in a village to 3. It is essential that in each selected plot there should be a minimum area of  $2 \times 2$  metres under tapioca. If a selected plot contains more than one patch under tapioca, satisfying the above requirements, then one patch is selected by simple random sampling method. In the selected plot/patch a square cut of  $2 \times 2$  metres will be located at random for conducting the experiment.

All the tapioca plants inside the  $2 \times 2$  metre square plot will be harvested. The produce will be cleaned by removing the soil sticking to the tubers and then weighed.

### 3. Sample Size

The total number of experiments planned for the survey on paddy during 1974-75, according to the seasons are given below :

Sl. No.	Season	No. of experiments planned
(1)	(2)	(3)
1	Autumn 1974	939
2	Winter 1975	968
3	Summer 1975	837
	Total	2744

The district-wise break up of the total number of experiments planned for the crop cutting survey on paddy during 1974-75 is given in table I in the appendix.

The total number of experiments planned in the case of tapioca during the year under review was 780. The district-wise split up of the total number of experiments planned for the survey is as below:

#### CROP COVERAGE AND SAMPLE SIZE—TAPIOCA

Year : 1974-75.

Sl. No.	District	Total number of experiments planned
(1)	(2)	(3)
1	Trivandrum	60
2	Quilon	90
3	Alleppey	60
4	Kottayam	75
5	Idukki	55
6	Ernakulam	90
7	Trichur	75
8	Palghat	65
9	Malappuram	60
10	Kozhikode	60
11	Cannanore	90
State total		780

#### 4. Field work

The field work of the surveys comprising selection of fields, identification of selected fields, location and marking of plots for crop cutting experiments, harvesting the crops and recording the weight of produce after the usual processing is carried out by the field staff of the Bureau of Economics and Statistics. The field work relating to the surveys is attended to by the Investigators under the supervision of the Statistical Inspectors and District Statistical Officers. It is reported that 126 Investigators attended to the field work of the crop cutting survey on paddy during Autumn 1974, 137 during Winter 1975 and 120 during Summer 1975.

The planning of the survey, quality check of the work of the field staff and the statistical analysis of the data collected are done at the Directorate of the Bureau of Economics and Statistics.

#### 5. Training

No formal training classes were held to impart refresher training to the Investigators at the district headquarters. However, all the Investigators attending to the crop cutting survey are adequately trained by the Statistical Inspectors.

## 6. Response

The number of experiments planned, analysed and the percentage response in respect of paddy during the three seasons in each district are given in table No. 2 in the appendix. Similar information relating to tapioca is given in table No. 7 in the appendix.

## 7. Supervision

The supervision of the field work is done by the Statistical Inspectors and District Statistical Officers. Since 1967-68, a fixed programme for inspection at harvest stage in the case of crop cutting experiments on paddy has been arranged so that in each taluk seven out of 18 experiments are to be inspected at harvest stage during each paddy crop season at the rate of six experiments by the Statistical Inspectors and one by the District Statistical Officer. Further the District Statistical Officer has to conduct harvest stage inspection on three pre-assigned samples in his district. Over and above this, inspection at pre-harvest and post-harvest stages will also have to be conducted by the Statistical Inspectors and District Statistical Officers.

Number of experiments inspected at the 3 stages are given below in percentages :

Sl. No.	Season	No. of experiments inspected (in percentages) at		
		Harvest	Pre-harvest	Post-harvest
(1)	(2)	(3)	(4)	(5)
1	Autumn 1974	32.4	29.5	7.8
2	Winter 1975	34.6	30.0	6.3
3	Summer 1975	30.2	16.8	5.7

Independent estimates of average yield of paddy based on harvest stage inspection are given in table 3 in the appendix.

As far as the crop cutting survey on tapioca is concerned, the Statistical Inspector has to conduct harvest stage inspection on 5 experimental plots in his taluk, while the District Statistical Officer has to supervise personally the harvest in 3 experimental plots in his district.

## 8. Results

The estimated mean yield of paddy together with percentage sampling error and the total production of rice during the 3 seasons of 1974-75 are given in table 4 in the appendix.

Usually the results of State series of Experiments and I. A. D. P. series of experiments conducted in Alleppey and Palghat districts are pooled for framing combined estimates. But in Autumn 74, the results of I. A. D. P. series of experiments obtained from Alleppey districts are found to be not poolable. In Palghat district, the I. A. D. P. series of experiments were not conducted during Autumn and Winter during the year under report due to the non-co-operation of the Village Extension Officers. Though the I. A. D. P. series of experiments were conducted in Alleppey District during Winter and Summer 75, the response was too low to frame any reliable estimate.

The State Government have already issued instructions to the Block Development Officers for the conduct of I. A. D. P. series of experiments with the Village Extension Officers in Alleppey and Palghat districts. It is hoped that the experiments will be conducted in 1975-76.

The results of experiments conducted for ascertaining the percentage recovery of dry paddy (dry grain) from harvested produce are given in table 5. The mean yield of paddy per hectare estimated for irrigated and unirrigated areas in respect of each district and the State are also given in this table.

The weight of cleaned rice is reckoned as 65.7% of dry paddy.

The statement showing the percentage of area under different improved agricultural practices during each of the 3 paddy crop seasons are given in table 6.1, 6.2 and 6.3.

The estimated yield rate and the total production of raw Tapioca in each district and in the State are presented in table 8.
