TRIVANDRUM.

**THE NATIONAL INSTITUTE OF MEDICAL RESEARCH**

## P R E F A C E

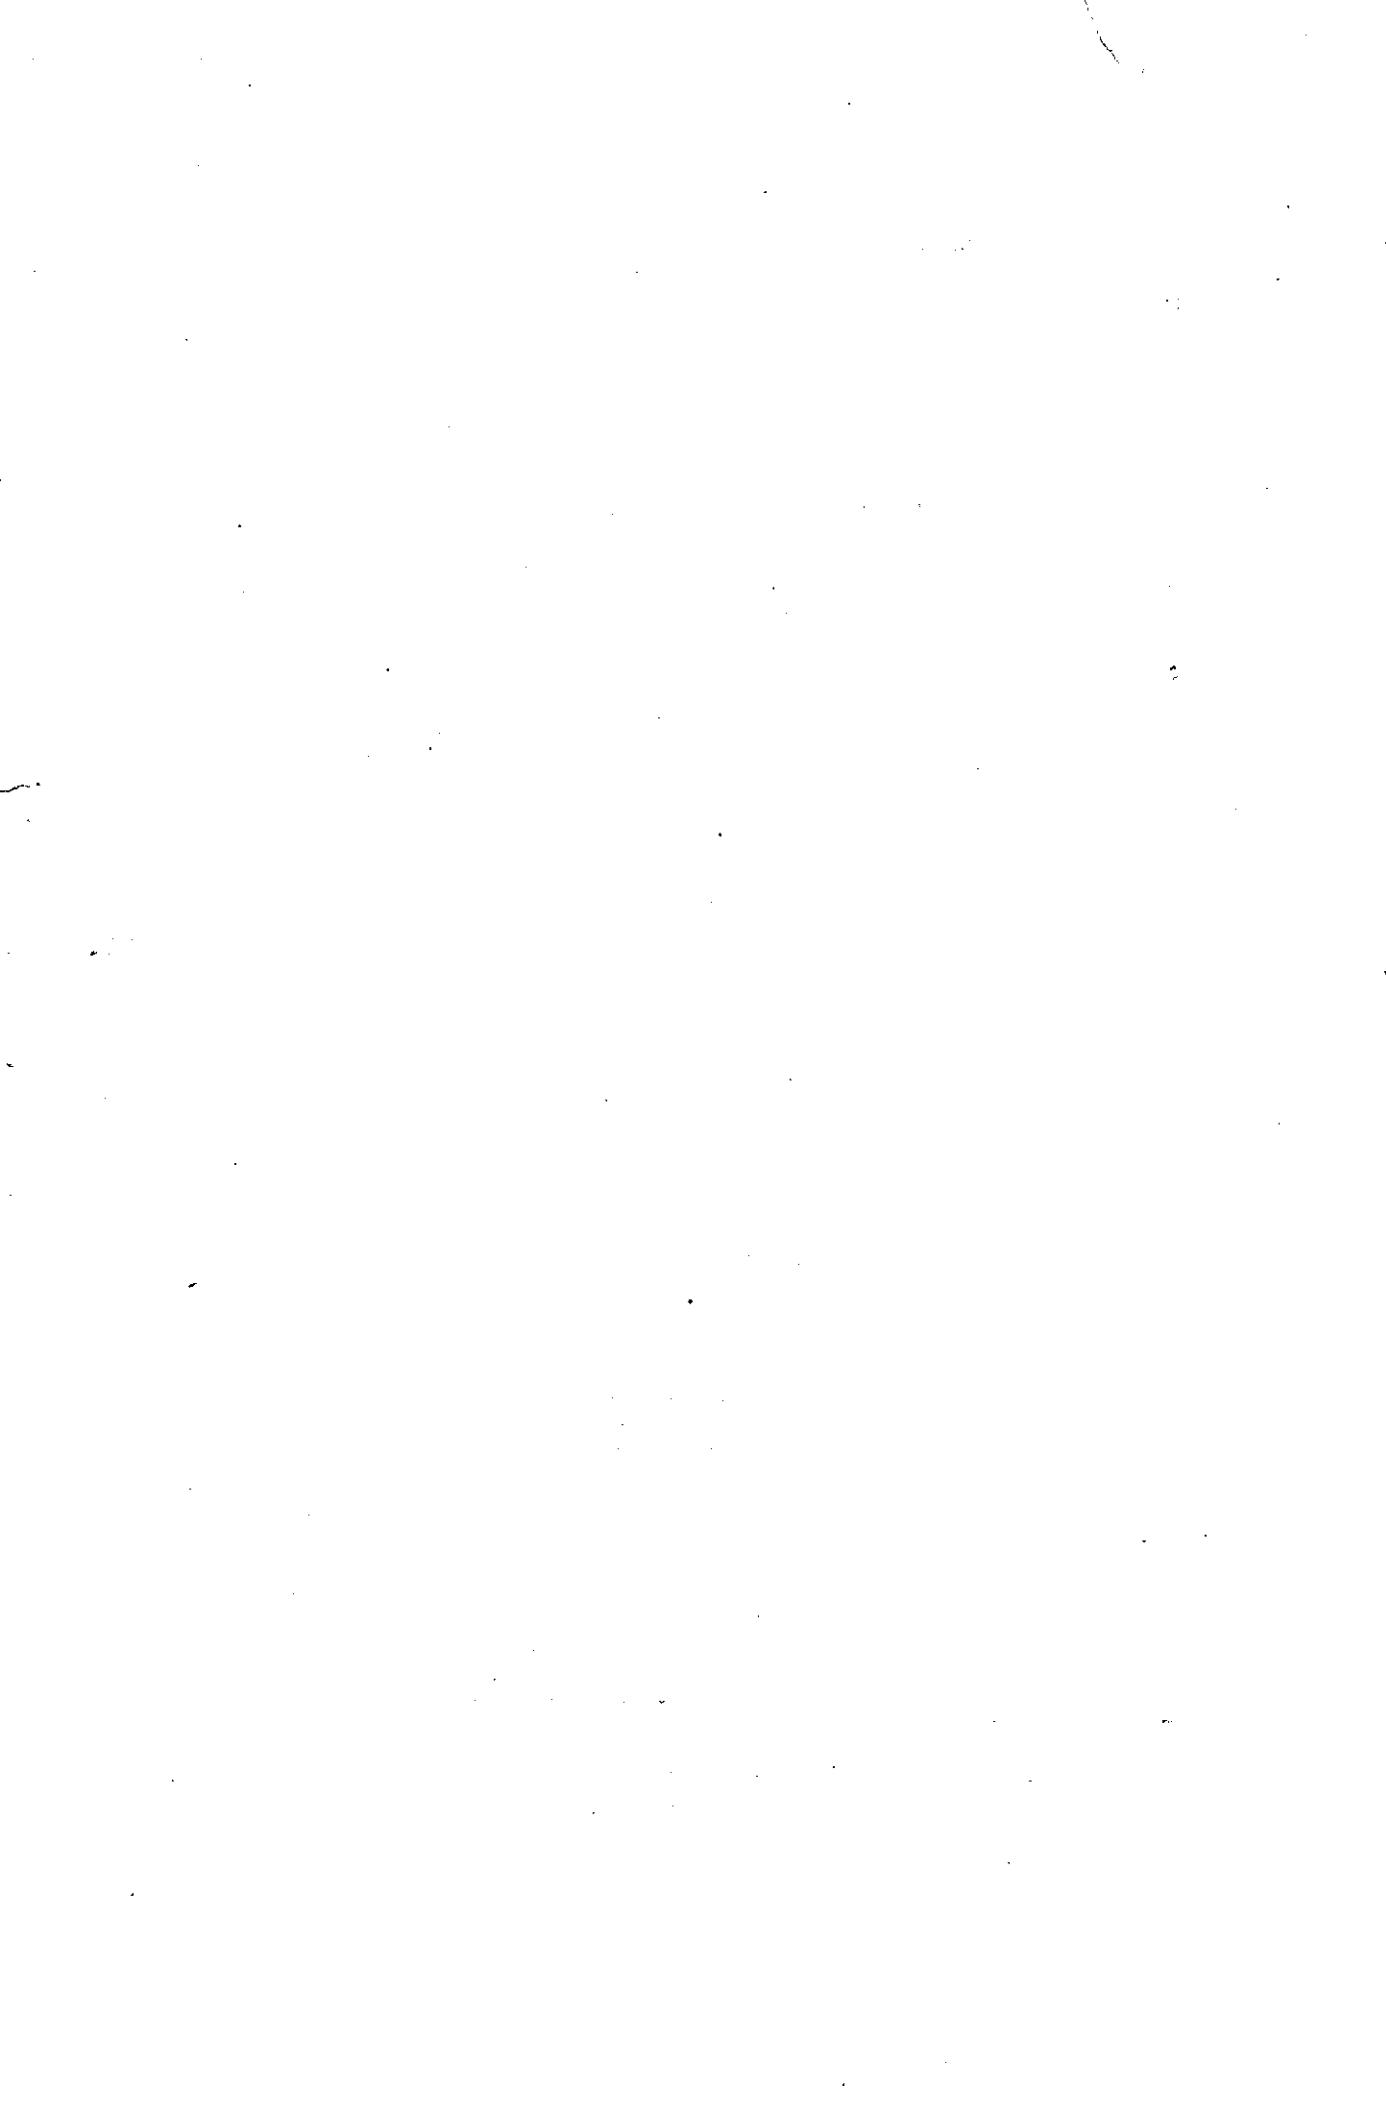

The organisers of the Santhosh Trophy Foot-ball Tournament held at Kochikode during December 1975 to January 1976, deserve to be congratulated for arranging a mini sterilisation camp at the Foot Ball grounds with the innovative extra incentive of free tickets to witness the semi finals and final matches. The opportunity was promptly availed of by Dr.P.Gopinathan Nair, Assistant District Medical Officer, Kochikode and Sri V.C.George, District Demographic Officer, Kochikode, who arranged to collect detailed data on the characteristics of those who have come forward to accept sterilisation at the foot-ball grounds. The initiative shown is appreciated.

The analysis of the data collected has been done at the Demographic Research Centre of the Bureau of Economics and Statistics and the present report is the result. The report reveals the selective nature of the acceptors at the foot-ball grounds, who are younger in age, of higher educational level and of lower parity, as compared to their counter-parts in other camps and under the normal programme. The organisers of the camp have paved the way for a new strategy in popularising sterilisation among people who congregate in meias, festivals and the like.

The report has been prepared by Sri G.Surendranathan Nair, Research Officer under the guidance of Sri P.S.Gopinathan Nair, Assistant Director. The draft was revised and finalised by Dr.R.S.Kurup in consultation with me.

## AN INNOVATIVE STERILISATION CAMPAIGN

(Report of a Mini Family Planning camp during Santosh Trophy  
Foot Ball Tournament at Kothikade from Dec. 2-1975 to Jan. 1976)

### 1. Introduction:

While Family Planning Festivals have been conducted in many parts of the country following the example of Ernakulam camp, the idea of taking Family Planning services including sterilisation to places like Railway Station where people congregate, has been successfully tried in Bombay. A combination of these two features has resulted in the conduct of a Mini sterilisation camp at the Foot-Ball ground in Kothikade, where Santosh Trophy Foot Ball Tournament was held during December 1975 to January 1976. A tournament of such events as Santosh Trophy attracts a large number of football lovers, especially in the Kothikade and neighbouring districts. Hence, among the foot-ball teams, people from all walks of life could be expected with a predominance of middle and young age groups. It is only in the fitness of things that the organisers of the tournament have thought of holding a mini sterilisation camp at the Football ground, with the unique additional incentive, of a free ticket costing Rs.15/- to witness the semi-finals and the final of the Santosh Trophy matches, to all those who undergo vasectomy at the mini camp. The formal compensation of Rs.20/- given to all acceptors of vasectomy was increased by Rs.17/- during the last nine days of the camp. Added to these, the acceptors were given tonic and vitamin tablets and 103 prizes to the winners (among the sterilised persons) in the lucky draw held on the last day of the camp.

This report attempts to present the characteristics of the 1012 persons who accepted sterilisation at the foot-ball ground as compared to the normal programme and other camps.

### 2. Source of data:

The salient socio-economic and demographic characteristics like age, religion, education, occupation, income, number of children born and living to persons sterilised, etc. are discussed briefly, followed by pointing out the distinct achievement of enlisting a large percentage of youth to accept sterilisation.

### 3. Age composition of acceptors

The acceptors of the mini camp seem to be drawn from the younger age groups to a larger extent than that of earlier mass camps. A comparison of the percentage of acceptors from the two crucial age groups, 20-29 and 30-39 given below is revealing.

TABLE -1

| Age group | Percentage distribution of sterilised persons<br>in the five age groups |                   |                                |                          |                          |                       |
|-----------|---|-------------------|--------------------------------|--------------------------|--------------------------|-----------------------|
|           | Kozhikode Mini camp (1976)  | Tirur camp (1972) | Thiruvananthapuram camp (1970) | 1st May 1971 camp (1971) | 2nd May 1972 camp (1972) | Currimore camp (1972) |
| 20-29     | 15.61   | 8.9               | 9.5                            | 19.5                     | 13.1                     | 6.5                   |
| 30-39     | 50.10   | 49.3              | 44.3                           | 46.3                     | 46.0                     | 43.3                  |

The percentage of acceptors from both the above age groups is distinctly higher than the corresponding percentages of all the earlier camps since 1970. Obviously, this could be due to the fact that the universe of foot-ball levers, from whom the sample of acceptors has come forward is younger in age. As against this, the proportion in the age segment of 40 years and above, among the total acceptors is lower than that of other camps. Still, the contribution of slightly more than one third of the acceptors in the age group 40 and above, points to the need for greater dissemination in accepting persons of younger age, as this will have a better demographic impact. The age group of acceptors among the three religious groups also show variation. Among the Christian acceptors, 83% belong to the age group 20-39 while the corresponding figure for Hindus is 67 and for Muslims 66. (Table 2 appended).

More significant is the age composition of the wives of sterilised males. Hence, it is interesting to compare the percentage of wives of sterilised males, in the high fertility age groups of 20-24 and 25-29.

Table 3

| Age group<br>of<br>wives | Wives of sterilised males - % in some important age groups |                       |  |                            |                           |
|--------------------------|--|-----------------------|--|----------------------------|---------------------------|
|                          | Kozhikode<br>Mini camp<br>1976                             | Tirur<br>camp<br>1972 | Thiruvananthapuram<br>2nd camp<br>1971 | Trivandrum<br>camp<br>1972 | Currimore<br>camp<br>1972 |
|                          | (1)  | (2)                   | (3)                                    | (4)                        | (5)                       |
| 20-24                    | 30.0   | 11.3                  | 15.8                                   | 20.3                       | 13.2                      |
| 25-29                    | 35.0   | 22.8                  | 27.4                                   | 29.4                       | 29.4                      |

As may be seen from above, there is marked difference in the proportion of acceptors from the younger age groups, at the mini camp.

#### 4. Religious composition

59% of the persons sterilised in the camp are drawn from Hindus, 25.3% from Muslims and only 5.8% from Christians. The religious composition of Kozhikode District

shows that 62% of the population are Hindus, 20.6% Muslims and 7% Christians. In this case, while Hindus are over represented, Muslims and Christians are under represented compared to their corresponding proportions in the total population. The phenomenon is observed in other districts also.

#### 5. Educational standard of acceptors:

A distinctive feature emerging from the analysis of the educational standards of acceptors is the comparatively lower percentage of illiterates. This category forms only 11.7%, as against 23% among acceptors of sterilisation in the District under the rural programme. A comparison with other camps may be seen from Table 4.

Table 4

#### Percentage of illiterates in the various camps

| Muslim<br>camp | Trichur | Perambra | Kannur |
|----------------|---------|----------|--------|
| (4)            | (5)     | (6)      | (7)    |
| 11.7           | 20.6    | 10.2     | 27.1   |

Quite contrary is the position, regarding the proportion of those at the other end of the educational scale - namely, matric and above. The percentage of this category among the acceptors at the mini camp is 12.6, as against only 5.5 among the acceptors of the rural programme.

The relatively lower literacy level of Muslims is evident in the case of mini camp acceptors also. 20% of the Muslim acceptors are illiterates, while this category forms only 9% among Hindus and 11% among Christians. On the other hand, the percentage of those who are "Matric and above" perceived among the Christian acceptors is significantly higher (16.6%) when compared with Hindus (11.7%) and Muslims (5.2%). (Table 5 appended)

The relevant figures are given in Table 2.

#### 6. Occupation

It would be interesting to find out the occupational classification of the acceptors, as this would throw light on the calibre of persons who come forward to accept sterilisation as against those who remain from accepting. 42.5% of persons sterilised in the mini camp belong to unskilled workers. 32.4% are drawn from semi-veterans and labourers. Traders and business form only 8.6%. An important factor to be noted here is that in the mini camp, only 1/6 of the acceptors are drawn from the category of agricultural labourers. The corresponding figure for the acceptors under the rural programme in the District is 7.8% and 1/3 of the total rural population. This could mean that the

-4-

agricultural labourers in general, lack interest in foot-ball match and the camp connected with it. Relevant figures (with District level figures in brackets) are given in Table 2 appended. Another notable characteristic of the camp is that 16% of the adopters in the camp belong to skilled workers. The corresponding district level figure for the normal programme is 6.5%.

Compared to the pattern of the adopters of the District, it may be pointed out that there is a notable increase in the proportion of traders, and businessmen, clerical workers and skilled workers and a sharp decrease in the proportion of the category of agricultural labourers, unskilled workers, cultivators and farmers. This shift in the pattern is evidently due to the relative predominance of certain occupational categories among the foot-ball lovers who are mostly drawn from urban and semi-urban areas. This finding is a pointer to future strategy of organising mini camps as part of fairs and festivals, where certain categories of people, who normally are not netted by the normal programme, are likely to congregate in large numbers.

#### 7. Income:

There is a tendency to project a low income by the persons who come to adopt sterilisation. Income reporting is always in tune with the level of concessions fixed by Government or other agencies. So the statement of income is rather pivoted on the level of concession or benefit. With this limitation, the income data are analysed. Only 17% of the adopters have reported a monthly income of more than Rs. 200/-. On an average those who have adopted sterilisation have a monthly income of Rs. 132/-. About 80% have reported an income of less than Rs. 200/-. Under the normal programme in the District, 80% have reported an income of less than Rs. 100/- (Table 7 appended).

#### 8. Number of children born and living

The average number of children born to a person at the time of sterilisation in the mini camp is 3.25. In fact 66.5% of the adopters have 3 or less than 3 children born to them at the time of sterilisation. The corresponding figure for the district under the normal programme is 53.3%.

An average of 3.24 children are living to persons sterilised in the mini camp. 66.7% of the adopters have 3 or less than 3 children living at the time of sterilisation. The corresponding figure for acceptors of normal programme in Kozhikode District is 56.4%. Comparison with other camps is given in the Table below:

Table 8

Percentage distribution of sterilised persons according to number of children living

| No. of children living | Kozhikode<br>Mini camp | Trichur | Trivan-<br>drum | Ernakulam  |            |
|------------------------|------------------------|---------|-----------------|------------|------------|
|                        |                        | (4)     | (3)             | 1st<br>(1) | 2nd<br>(2) |
| 2 & below              | 37.7                   | 19.7    | 25.4            | 22.8       | 22.4       |
| 3                      | 25.0                   | 22.7    | 25.6            | 27.6       | 26.3       |
| 4 +                    | 33.3                   | 57.6    | 49.0            | 49.6       | 51.3       |

34.4% of adopters have only two children living at the time of adoption. In other camps the proportion of those with two living children are in the range of 39% to 55% (Table 9 appended). This remarkable increase in the proportion of adopters having only 2 living children in the mini camp may have some bearing on the enthusiasm of the young, educated or skilled workers towards Santosh Trophy foot-ball tournament. Another salient feature to be noted here is that 85.8% of those who had no male children and 88.4% of those who had no female children living, had 3 living children at the time of sterilisation. This indicates the general trend towards family planning; and their consciousness of family size is so great that the people terminate their reproduction as soon as they get three children living, no matter whether they got children of either sexes (Table 10 appended).

The average number of children living at the time of sterilisation for Hindus comes to 3.12 and for Mians it is 3.19 and Muslims it is 3.57. 72.8% of the Christian adopters have 3 or less than 3 children living (Table 11 appended) and the corresponding proportions for Hindus and Muslims are 69.9% and 56.4% while 64% of the Christian adopters have 3 children living at the time of sterilisation, only 27.9% of Hindus and 28.4% of Muslims have 3 children living at the time of vasectomy (Table 11 appended). As a matter of fact 21% of the adopters have no male children living at the time of sterilisation and 13.3% of the adopters have no female children (Table 10 appended).

#### 9. Interval between the age of last live birth and acceptance of sterilisation.

The age of the last living child gives an indication of the period, between the latest delivery of the wife of the vasectomised person and the acceptance of sterilisation. It would be better if this period is as short as possible; as otherwise, use of some other temporary method has to be suspected. When there is a long interval between last live birth and date of sterilisation without contraceptive use, the possibility of secondary sterility has to be considered. In such a case the sterilisation is rather unwanted.

The average interval between the date of the last live birth and acceptance of sterilisation comes to 20 months. In more than two-third cases, the period is above 12 months. Unfortunately data on contraceptive use, if any, during the interval have not been collected.

#### 10. Conclusions and implications.

The idea of taking family planning service to those who are in need is implied in the organisation of family planning camps at places where people assemble for one reason or the other i.e. at the site of festivals, fairs, railway stations, tournaments etc. Kozhikode mini camp is of that type.

Cash incentives are offered to persons sterilised in the mini camp as in other camps. The only added attraction in the package of incentives offered is the free tickets to witness the Santosh Trophy semi and final foot-ball matches.

This has apparently influenced the foot-ball lovers who availed of the family planning facilities of these camps in greater numbers.

Comparing the present camp with that of the previous camps of the State, one can easily find that the acceptors of this camp are younger than the acceptors of other camps and are drawn from a particular section of the people comprising traders, business men, clerical and skilled workers. Their desire to limit the family size and to witness the Santosh Trophy are simultaneously satisfied. This camp indicates that there is still scope for extending the strategy of holding special family planning camps so as to suit the category of people desired to be brought under family planning fold.

Regarding the number of children living to persons sterilised in the camp, it may be pointed out that there is average of 2.24 living children to persons sterilised in the mini camp, while the corresponding figure for Kochi-Kode cluster is 3.9. On the basis of this difference, the birth rate by the sterilisation at this camp will be higher by 1.7% than in the normal programme. Hence, it may be concluded that this innovative approach has yielded comparatively better results in terms of demographic effect as compared to the normal programme. It is hoped that such attempts will be repeated and the performance of the family planning programme in the State will improve in the years to come.
