## from Editors Desk

The  $V^{th}$  Economic Census which is the complete count of all entrepreneurial units in the country is going to be conducted during May June 05. This massive operation covering the entire country is second only to population census. The conduct of Economic Census in the state is entrusted to DES by C.S.O. For the first time I.C.R technology is used for processing which will enable speedy preparation of reports. The data generated is very much useful for various planning purposes

The department has already started preliminary work for the conduct of the census. The success of this operation depends on the joint effort of all as one body and soul. I request the co-operation of all in this endeavor

I also took this opportunity to acknowledge the meritorious service rendered by Sri. P. Surendran Pillai, (Joint Director) one of the Associate Editors, in bringing out this publication regularly, who is due to retire in the month of March 2005

I extend my sincere thanks to him for his whole hearted co-operation. I wish him a happy and prosperous retired life

**M.R. Balakrishnan**

**The costs, effects and cost-effectiveness of strategies to increase coverage of routine immunizations in low-and middle-income countries: systematic review of the gray literature**  
*Katherine Batt, I.J.A. Fox-Rushby, 2 & Marianela Castillo-Riquilme*

#### Introduction

Immunization against the six diseases included in the traditional Expanded Programme on Immunization (EPI) schedule (poliomyelitis, diphtheria, pertussis, tetanus, measles and tuberculosis) is one of the most cost-effective ways to improve child health(1). However many countries have not achieved the expected coverage levels(2),and even those reaching 80% experience much variation between districts. For example, in India in 1992-93, 71.0% of the richest children were protected from measles whereas only 22.8% of the poorest 20% of children received such protection(3,4).Therefore, arguments to increase efficiency and equity can drive policy on increasing coverage rates.

A recent review of published literature(5) suggested that the most effective strategies to increase coverage were community health workers and door-to-door canvassing, and the least costly were peer training and door-to-door canvassing. However, the conclusion was drawn cautiously because there was little evidence (60 papers); the quality of evidence was poor (only 29 interventions once the lowest quality papers were excluded); the literature was old (24/29 interventions were evaluated in the 1980s); and all interventions had not been evaluated. Therefore, the authors recommended

searching the grey literature to increase the evidence base.

Grey literature has been defined as "a range of published and unpublished material which is not normally identifiable through conventional methods of bibliographic control" (6). Searching the grey literature can broaden the evidence base, overcome publication bias (7,8), and highlight ongoing research. However, searches of grey literature are labour intensive, and efficient strategies vary by topic(9,10). Because this literature may not be peer reviewed there is also debate over its potential value.

#### Organ trafficking and transplantation pose new challenges

The international trade in human organs is on the increase fuelled by growing demand as well as unscrupulous traffickers. The rising trend has prompted a serious reappraisal of current legislation, while WHO has called for more protection for the most vulnerable people who might be tempted to sell a kidney for as little as US\$ 1000.

Increasing demand for donated organs, uncontrolled trafficking and the challenges of transplantation between closely-related species have prompted a serious re-evaluation of international guidelines and given new impetus to the role of

# Health & Population

WHO in gathering epidemiological data and setting basic normative standards.

There are no reliable data on organ trafficking – or indeed transplantation activity in general- but it is widely believed to be on the increase, with brokers reportedly charging between US\$100 000 and US\$ 200 000 to organize a transplant for wealthy patients.

Donors-frequently impoverished and ill educated may receive as little as US\$ 1000 for a kidney although the going price is more likely to be about US\$ 5000.

A resolution adopted at this year's World Health Assembly (WHA) voiced "concern at the growing insufficiency of available human material for transplantation to meet patient needs," and urged Member States to "extend the use of living kidney donations when possible, in addition to donations from deceased donors."

It also urged governments " to take measures to protect the poorest and most vulnerable groups from 'transplant tourism' and the sale of tissues and organs, including attention to the wider problem of international trafficking in human tissues and organs."

Earlier this year, police broke up an international ring, which arranged for Israelis to receive kidneys from poor Brazilians at a clinic in the South African port city Durban. But such high-profile successes merely scratch at the surface.

Countries such as Brazil, India and Moldova- well-known sources of donors- have all banned buying and selling of organs. But this has come at the risk of driving the trade underground.

Behind the growth in trafficking lies the increasing demand for transplant organs.

In Europe alone, there are currently 120 000 patients on dialysis treatment and about 40 000 people waiting for a kidney, according to a report last year by the European Parliamentary Assembly.

It warned that the waiting list for a transplant, currently about three years, would increase to 10 years by 2010, and with it the death rate from the shortage of organs.

In Asia, South America and Africa, there is widespread resistance – for cultural and personal reasons as well as due to the high cost – to using cadaver organs, or those from dead bodies.

The majority of transplanted organs come from live, often unrelated, donors. Even in the United States, the number of renal or kidney transplants from live donors exceeded those from deceased donors for the first time in 2001.

Yet the Guiding Principles on human organ transplantation, adopted by the WHA in 1991, state that organs should "be removed preferably from the bodies of deceased persons," and that live donors should in general be genetically related to the

recipient They also prohibit " giving and receiving money, as well as any other commercial dealing".

This year's WHA resolution therefore asked WHO Director –General Dr LEE Jong-wook to consider updating the guiding principles in the light of current practices.

" There is a real risk that standards devised in the 1990s with the emphasis on prohibition will be undermined and we have to react to this," said Dr Nikola Biller-Andorno, ethicist at WHO's Department of Ethics, Trade, Human Rights and Health Law.

What is needed is a critical and thorough analysis of the different proposals that have been made particularly with regard to expanding the use of living donors, by providing incentives and/ or removing disincentives." Dr Biller-Andorno said.

Dr Luc Noel, coordinator of the newly created Clinical Procedures team in WHO's Department of Essential Health Technologies, said part of the review process included examination of how to minimize health risks to living donors after the donation.

"Removing disincentives is a must. Adding incentives is where things get difficult," Noel, said.

For instance, should a donor in a country with no health insurance be offered free coverage in case he or she gets a complication after the operation? And would this qualify as an incentive or removing a disincentive?

A WHO consultation on organ and tissue transplantation in Madrid last October, grouping 37 clinicians, social scientists, ethicists and government officials from 23 countries, reached no consensus on how and where to draw the line between removing disincentives and providing incentives.

The Madrid consultation unanimously agreed that there should be a WHO expert advisory panel both for allogenic transplantation, involving organs from an organism of the same species, and xenogeneic transplantation, involving those from another species, and for global safety and quality principles for the regulation of organs and tissues.

Noel said there was a need for more epidemiological data and for more global transparency- especially with regard to the long-term health, psychological and socio-economic consequences for both living donors and recipients.

Source: SPICE INDIA

Turmeric (*Curcumalonga L*) the most popular colouring spice is gaining more significance as a healing spice. As a therapeutic agent, it is valued as anticancer us, ant diabetic, anti-inflammatory and antiseptic. The properties of turmeric, as a spice or as a medicine, are ascribed to the colouring principle, circumin.

8. Stamp duty for registration increased
9. 10 % luxury tax to discourage extra vagance in wedding
10. As VAT is going to be introduced from 1-4-05- structural adjustment in the system suggested

## Internet – Assisted Decision- Making MANUEL FERNANDEZ

### Abstract

No business can survive without effective decision-making. Decision-making lies deeply embedded in the process of management. Decision-making requires special skill and right information at the right time in the right format. Today information is a basic resource and the goodness of the decision depends on the quality of information. Globalization has enhanced the importance of decision-making. Decision making in global enterprises is highly complex and the decision maker requires timely, relevant and appropriate information of things taking place around the globe for making good decisions. Internet can give information from all over the world and facilitate the decision maker to make appropriate decisions.

### Introduction

The Industrial Revolution brought great opportunities of growth in business and it was necessary for the owners to finance their expansion through equity financing and to separate ownership and control, in effect creating the class of employees known as management. This evolved into the managerial revolution of the 1920s when the separation of ownership and control became a firmly entrenched part of business. It was finally that management was a separate activity that required its own set of skills, which revolved primarily around decision-making and problem solving. The globalization of the world economy had enhanced the importance of decision-making and has made it highly complex

### Globalisation

Globalisation is the expansion of economic activities across political boundaries. It is a process of increasing economic integration and growing economic independence between countries. Globalisation is a process of development of the world into a single integrated economic unit characterized by free flow of trade and factors of production across borders.

The sweeping political and consequent economic polity change in the erstwhile communist

and socialist countries, dramatic shifts in the economic policies in a large number of countries as diverse as communist countries like China to democratic countries like India and the liberalization of trade and investment fostered by the GATT/WTO have added momentum to the forces of globalization.

Decision-making in global enterprise is highly complex and decision makes require timely, relevant and appropriate information of things taking place around the globe for making good decisions. Internet can give information from all over the world.

### Internet

The Internet was designed in part to provide a communications network that would work even if some of the sites were destroyed by nuclear attack. If the most direct route was not available, routers would direct traffic around the network via alternate routes. Since the government initially funded the Internet, it was originally limited to research, education, and government uses. Commercial uses was prohibited unless they directly served the goals of research and education. This policy continued until the early 90s when independent commercial networks began to grow. It then became possible to route traffic across the country from one commercial site to another without passing through the government funded NSF Net Internet backbone.

Delpgi was the first national commercial online service to offer Internet access to its subscribers. It opened up an email connection in July 1992 and full Internet service in November 1992. All pretenses of limitations of commercial use disappeared in May 1995 when the National Science Foundation ended its sponsorship of the Internet backbone, and all traffic relied on commercial networks. Microsoft's full-scale entry in to the browser, sever, and Internet Service Provider market completed the major shift over to a commercially based Internet. The release of window s 98 in June 1998 with the Microsoft browser well integrated into the desktop gave the fillip for the enormous growth of the Internet

*Global Online Populations*

Nation	Population	Internet User	Percentage
Argentina	37.4 million	2.0 million (D.Alessio IROL)	5.35
Australia	19.4 million	5 million ((eMarketer))	25.77
Australia	8.2 million	2.7 million (Australian Internet Monitor)	32.95

United Kingdom	59.6 million	33.0 million (Jupiter MMXI)	
United States	278 million	149 million (Computer Industry Almanac)	

## Decision Making

Decision-making is the choosing/selecting of an optimum course of action from several alternative courses of actions. It is a part of every manager's job, because he must constantly choose what is to be done, who is to do it and when it is to be done. No business can survive without effective decision-making. Decision-making is an essential part of every function of management. In the world of Peter F. Drucker, "Whatever a manager does, he does through decision-making." Decision making lies deeply embedded in the process of management. Managers not only must make correct decisions but must also make them as and when needed and as economically as possible. It is the information that guides them to the right action.

At present business are complex and the environment in which they operate is becoming complex day after day primarily due to the technological revolution, research and development, product changes, information explosion and globalization. Managing in a complex environment means the executives are dealing with more and more variables, with the result that most managers have more information available than they can effectively handle. Irrelevant information may overload decision-makers and lead to inferior performance (Ackoff 1967; Lucas 1975; Hollnagel 1987), whereas, relevant information leads to better decision-making (Cook 1968; Adams and Swanson 1976; Zmud 1979; Ahituv and Neumann 1987; Keller and Staelin 1987; Nicholas 1987).

Thus, in order for the management to be productive, they do not need more information but they need better information. If the growing demand for better information is to be satisfied, organizations must improve their ability to retrieve specific information as and when needed. Traditional data processing techniques, such as batch and online computer systems, may not be adequate to meet organizational decision-making needs. Newer techniques such as the individual processing of personal computers and the ability to link personal computers to one another and to central computers creates opportunities for organizations to restructure their individual data files into databases. In this approach management looks at what data

exists and where it is found out how to record or capture it, consolidates it into either a single company database, or several key data bases, and provides users access to the information stored there so they can be directly involved in assembling the data to analyse a problem or tackle an opportunity and make a decision. This is what is done by or expected to be done by Management Information.

## Information and Information Systems

In the past, information used to be considered a bureaucratic nuisance and a limited tool for management decision-making. But in the last few decades there has been a revolution in the way that organizations treat information and information systems. Without information, a business simply cannot survive. Information flows are to the life and health of a business the glow of bold is to the life and death of an individual. All managerial functions, are performed through decision-making; for taking rational decision, timely and reliable information is essential.

Information systems provide support for management at all levels operational control, management control, and strategic planning. Each of these classes of management activity includes planning control and decision-making (Gordon 1984). The recipe for a good decision is 90 percent information and 10 percent inspiration (Murdick 1996).

An information system is a set of interrelated components that collect (or retrieve), process, store, and distribute information to support decision making and control in an organization. From a business perspective, an information system is an organizational management solution, based on information technology, to challenges posed by the environment (Lauden 1996).

The purpose of a computer-based information system is to collect, store, and disseminate information from an organization's environment and internal operations for the purpose of supporting organizational functions and decision-making, communications, coordination, control, analysis, and visualization. Information systems transform raw data into useful information through three basic activities: input, processing and output (Lauden 1996).

### Management Information System

The role of Management Information System (MIS) in an organization is akin to the role of the heart in the body. The information is the blood and MIS is the heart. In the body the heart plays the role of supplying pure blood to all the elements of the body including the brain. The heart works faster and supplies more blood, when needed. It regulates and controls the incoming impure blood processes it sends it to the destination in the quantity needed. It fulfills the needs of blood supply for the human body in the normal course and also in a crisis. The MIS plays exactly the same role in the organisation. The system ensures that appropriate data are collected from various sources, processed, and sent to all the needy destinations. The system is expected to fulfil the information needs of the management.

### Decision Support Systems

In the 1970s, a number of companies began developing information systems that were quite different from traditional MIS systems. These new systems were smaller in terms of labour and cost. They were interactive and were designed to help end users utilize data and models to discuss and decide (not solve) semi structured and unstructured problems. Decision Support System (DSS) are computer-based information systems that provide interactive information support to managers during the decision-making process. DSS use (1) analytical models, (2) specialized databases, (3) a decision maker's own insights and judgments, and (4) an interactive, computer-based modeling process to support the making of semi structured and unstructured decisions by individual managers (O'Brien 1999). Decision support systems allow the decision maker to retrieve data and test alternative solutions during the process of problem solving. By the late 1980s, these early efforts to assist individual decision-making were extended to groups and to the entire organisation (Lauden 1996).

### Group Decision Support System

The early work in DSS focused largely on supporting individual decision-making. However, because so much work is accomplished in groups within organisations, during the late 1980s system developers and scholars began to focus on how computers can support group and organisational decision-making (Lauden 1996).

A GDSS is an interactive computer-based system to facilitate the solution of unstructured problems by a set of decision-makers working together as a group

(Desanetis and Gallup 1987). GDSS can use information technology to make group meetings more productive by facilitating communication as well as decision-making. It supports any activity where people come together, whether at the same place at the same time or in different places at different times. GDSS meetings can be more productive, make more efficient use of time, and produce the desired results in fewer meetings (Lauden 1996).

### Conclusion

For decision-making whether it is individual or group-the decision maker(s) require complete information regarding the problem at hand. In the globalize business the decisions are taken for the transnational enterprise. Hence the decision-maker(s) require global information. Internet, which interconnects networks of thousands of networks of computers and databases and which is growing at an exponential rate is able to provide information from any part of the globe, thereby facilitating the decision-maker(s) to take appropriate decisions based on relevant and complete information. Moreover, by connecting their business to this online global infrastructure, companies can convene group meetings/group decision-making meetings at a particular geographical location, though the various members of the group may be physically at different geographical locations. They need not waste time and money flying from one place to another to participate in various meetings; they can participate in the meetings/decision making process by logging on "to the group meetings. The valuable scarce professions can be optimally utilised with little wastage of their time and energy at a relatively low cost.
