PREFACE

Civil Registration System is a continuous, permanent and compulsory recording of the occurrence and characteristics of vital events like Births, Deaths and Still Births. The main objective of the Civil Registration System is to record the annual change in population at National and State Level between two successive decennial Censuses. The registration of births and deaths has been made statutory through Registration of Births and Deaths Act 1969, which came into force in the State on 1st April 1970 vide Government of India Gazette Notification dated 21st March 1970 along with many other States.

The registering authorities at the local bodies are Secretaries of Grama Panchayats, Health Inspectors of Municipalities, Health Officers of Corporations and the Executive Officer of Kannur Cantonment. This report titled “Annual Vital Statistics Report 2019” provides an overview of the working of the Civil Registration System (CRS) in the state and presents a compilation of data on registered births, deaths, infant deaths and still births with rural-urban & sex-wise break-up based on Civil Registration Records.

The report was prepared by the Vital Statistics division of this office under the supervision and leadership of Sri P.P. Sajeevu, Additional Director (General) & Additional Chief Registrar of Births & Deaths. The sincere efforts put in by Smt. Sindu Mol. K.G, Statistical Assistant Gr.I, Smt. S.A. Suma & Sri. B. R. Rajesh Kumar, Research Assistants and the timely advice and guidance given by Sri. C. Madhavan, Deputy Director, Vital Statistics Division to bring out this publication is very much appreciated.

I would like to place on record my appreciation for the co-operation and valuable services rendered by the IKM, Local Registrars, District Registrars, Deputy Directors and staff of the District Offices of Economics & Statistics for bringing out this publication.

I hope that this report would immensely benefit to those who work in the Health sector and Researchers in the field. Suggestions for further improvement of the report will be highly appreciated.

Chapter -1

The Civil Registration System in Kerala - Introduction

Registration of Births and Deaths is an important source for demographic data for socio-economic development and population planning. In India, the need for dependable demographic data was felt soon after independence heralding the era of Five Year planning. In the beginning, the registration of births and deaths started on voluntary basis and there was no uniformity in statistical returns resulting in both under registration and incomplete coverage. In order to unify the civil registration activities, the Civil Registration System (CRS) was introduced in India under the Registration of Births and Deaths Act (RBD Act), 1969. Civil Registration System may be defined as a continuous recording of vital events such as births, deaths and marriages occurring in a population. The basic uses of data from Civil Registration System are:

- *Maintenance of permanent records on births and deaths as legal documents.*
- *Assessment of continuous changes in population.*
- *Evaluation of success of socio-economic programmes by indicators based on vital events and size of population.*

As a matter of fact, requirement of this system as legal proof of births and deaths should in itself be strong enough reason for any country to have a fully operational CRS. In India the registration of vital events and the administrative machinery for this purpose has been in existence for more than a century. It had been working under diversified Acts and executive instructions thus making it unsuitable for the independent India.

1.1 Registration of Births and Deaths Act 1969

This Act replaced the then existed laws and unified the system of registration throughout the country. Under the RBD Act 1969, registration of births and deaths is made compulsory. It has become mandatory on the part of head of house hold or his representative to report and register domiciliary vital events, for medical officers in charge of medical institution in respect of births and deaths occurring in these institutions. The Act also provided the statutory authority at Centre, State, District and local level. It prescribed definitions, principles, personnel and penalties connected with enforcement of the Act. It enabled Central Government to insist uniformity in registration procedures and bring out comparability in vital statistics registered in different parts of the country.

Statistics of births and deaths are compiled on the basis of Civil Registration System introduced under the Registration of Births and Deaths (RBD) Act, 1969. It is required under the Act that each vital event should be reported within 21 days from the date of occurrence of the event. This Act also provides for registration of events beyond 21 days on payment of some penalty. In the case of large delays, registration can only be done after taking the permission of the District Magistrate.

National Level

At national level the Registrar General of India (RGI) administers the CRS. He is empowered to issue general directions and take steps to co-ordinate and unify the activities of Chief Registrars of the States, who are the Chief Executive authority in the states for executing the provisions of RBD Act 1969 and the rules and orders made there under. They were responsible for coordinating, unifying and supervising the work of CRS within their respective state.

State Level

The Registration of Births and Deaths Act 1969 (Central Act 18 of 1969) came into force in Kerala on 1st April 1970 by the Government of India Gazette notification dated 21st March 1970 along with many other states. 1.3 The Process

The data reporting forms contain details of birth, death and still birth. Birth registration form contains information on date of occurrence/registration, usual residence of mother, place of birth, sex and weight of the child, order of birth, type of medical attention at birth, type of delivery and characteristics of the parents including their name, age, religion, educational status, occupation etc. In the case of death, information includes name, sex, age, marital status, religion, occupation, usual residence of the deceased, place of occurrence, date of occurrence/registration, cause of death, whether medically certified or not and kind of medical attention received at the time of death and characteristics of the mother, pregnancy period etc. in the case of still births. These forms have two parts: legal and statistical. The statistical part of the vital events registered in the registration units are entered in to the Sevana software developed by IKM, Kerala. The Vital Statistics Division of the DES prepares this report as per the methodology and instructions issued by the Registrar General of India (RGI) from time to time. The report contains district-wise statistics of births, deaths, infant deaths, still births and the related vital rates. Information Kerala Mission (IKM) has provided "Sevana" package in all the Grama Panchayats, Municipalities and Corporations for registration of births and deaths and issue of certificates.

1.4 Limitations of the Data

As far as the level of registration, Kerala has attained cent percent record in the registration of births and 99.5 percent in the case of deaths. Some events are seen unregistered. This may be due to lack of awareness about the need and importance of registration of births and deaths and lack of registration procedure knowledge among the public. This may affect the quality of the statistical data. Efforts are being taken to create awareness about the importance and necessity of registration. More over Cochin Corporation was not sharing data through IKM (Sevana Software) and hence from Cochin Corporation's data not included in this report for calculating Vital Rates & and also Detailed Tables.

1.5 Status of Reporting

The local bodies, viz., the Grama Panchayats, Municipalities and Corporations function as the registration units of vital events in the State. Place of Occurrence of events and Year of Registration are the criteria used in the report for compiling vital events. Total Registration units in the State are 1035 units. The details of registration units (Rural & Urban) are given in table A1. Utmost care has been given for the above process avoiding duplications and omissions, and eventually a cent percent reporting was achieved both in rural as well as urban areas.

Chapter -2 **Analysis of Vital Events – Live Births**

2.1 Registered Live Births

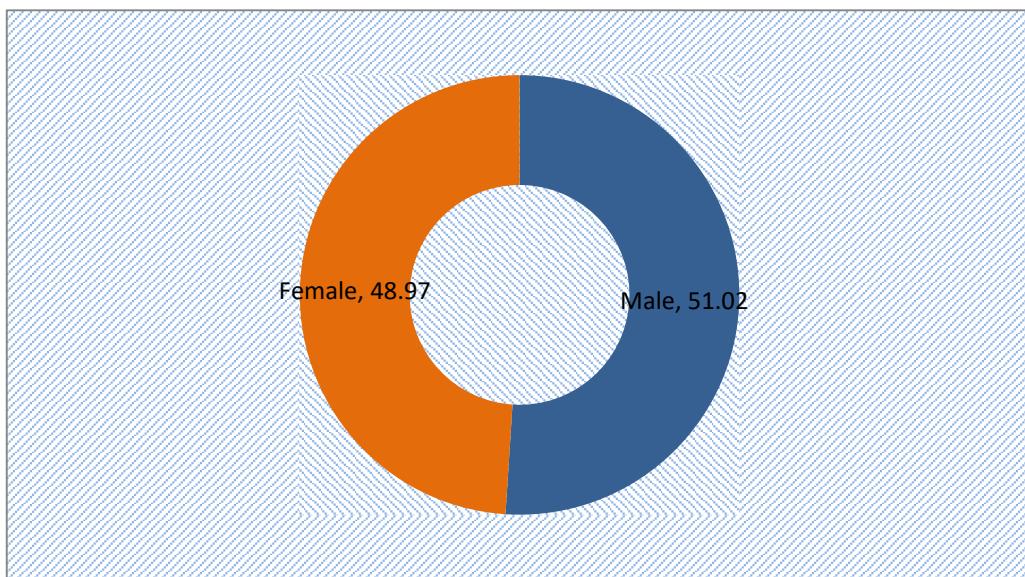

Total number of live births registered during the year 2019 was 480113. Of these, 244953 are males, 235129 are females and the remaining 31 cases are not reported its sex. It is seen that more males (51.02%) were born than females (48.97%) which resulted to a sex ratio at birth of 960 females per 1000 males.

The following Table 2.1(i) shows the registered live births by sex. Also the chart 2.1(i) presents the pictorial presentation of percentage of live births registered by sex

According to the number of live births registered by area, 140314 births (29.23%) were reported from rural areas and 339799 births (70.77%) from urban areas. The following Table 2.1(ii) provides the area is (Rural/Urban) registered live births and the chart 2.1(ii) shows the

2.2 Time Gap in Registration of Birth

The registered births have been classified into four categories depending upon their period of registration. The four time periods considered for the purpose are: i) within the prescribed time limit (up to 21 days), ii) After 21 days but within 30 days, iii) After 30 days but within 1 year, iv) More than 1 year. Under the RBD Act 1969, all vital events are to be registered within 21 days from the date of occurrence of the event. Even though there exists a system of birth registration at the place of delivery (hospital) through the institution concerned, there were delayed registrations still prevails. The percentage of registration achieved out of

total registration undertaken in the year 2019 within the prescribed time limit (up to 21 days) is 87.03%. As per Rural/Urban wise classification, it is 81.94% in rural area and 89.14% in urban areas.

While analyzing the percentage of births registered within the prescribed time period of 21 days to the total births registered in the districts, it is seen than 6 districts have achieved more than 90% registration of births within the prescribed time limit of 21 days. Further, 5 districts are in the category of more than 80 to less than or equal to 90 percent and the remaining 3 districts are in the category of more than 75 to less than or equal to 80 percent in completing the birth registration within time limit of 21 days

During the year 2019, 12.97% births registered were reported as delayed registration. In the case of rural area, it is 18.06%, where as in urban area, delayed registration reported is 10.86%. District wise details of time gap in registration of live births are given in Table B3(i), B3(ii) and B3(iii).

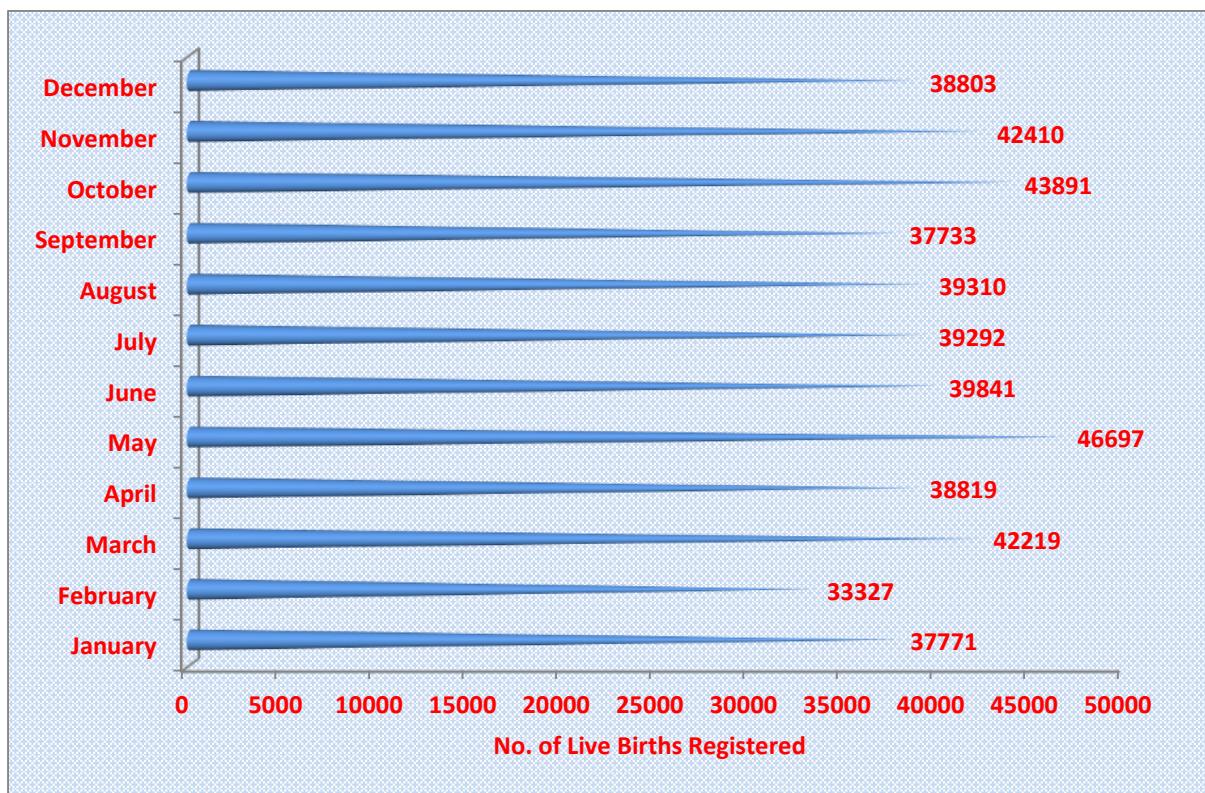

2.3 Live births by month of occurrence

In 2019, highest number of births occurred in May with 46697 (9.73%) of the total births in the State. It was followed by the months of October (9.14), November (8.83%) & March (8.79%). The month of February (6.94%) had the least number of births registered in 2019. The month wise live births registered during 2019 are shown in the following table 2.3 and chart 2.3

2.4 Sex Ratio at Births by Month and Districts wise

The Sex Ratio (Number of females per thousand males) at birth is an important indicator to map the sex differential of the population at the beginning of their life. The sex ratio at birth by month and district wise for the year 2019 is shown in the following table 2.4(1) & 2.4(2) While analyzing the month wise Sex Ratio at birth, the highest Sex Ratio at birth reported during the month of June and the lowest in the months of February, April and December. In the case of district wise births reported, it is seen that sex ratio at birth is highest in Idukki, followed by Pathanamthitta and Kottayam and the lowest in Palakkad district. Chart 2.4(i) & 2.4(ii) gives the pictorial presentation of sex ratio at birth by month wise & district wise.

2.6. Live birth by Type of delivery

Delivery or childbirth can be categorized on the basis of place of delivery, type of delivery (normal/caesarean section) and the personnel conducting delivery. These factors affect the chances of survival and subsequent health of mother and child.

The following Table 2.6 gives the percentage distribution of institutional child births by type of delivery. During 2019, the percentage share of institutional deliveries to total live birth is 98.96%. While considering the institutional wise, it is seen that out of the 149442 Live births occurred in Govt. Hospitals, 59.87% are normal deliveries and 38.70% are caesarians. But in the case of private hospitals, out of 325675 live births occurred, the percentage of normal deliveries and caesarians are 54.47% and 41.92% respectively. It is also noted that in both the type of institutions, percentage of normal deliveries are more than that of caesarian. The pictorial presentation of percentage distribution of institutional live births by type of delivery is given in the following charts 2.6(i), 2.6(ii) & 2.6(iii).

2.12. Live births by duration of pregnancy and birth weight

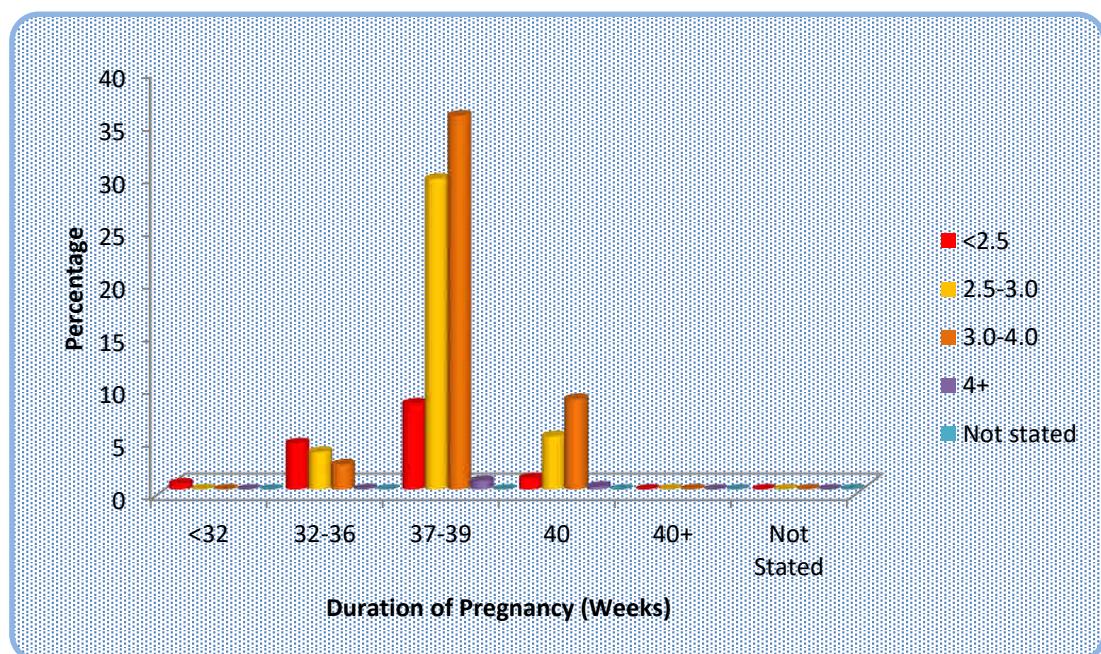

One of the important causes of still birth and infant death is due to premature delivery. Again premature babies having low birth weight(less than 2.5kg) are susceptible to diseases. Out of the total live birth registered during the year 2019, 14.22% were born with low birth weight. A clear association between duration of pregnancy and birth weight can be observed in the following Table 2.12. It is seen that 38.13% of babies having birth weight between 2.500-3.000 kg and 46.45% of babies having weight between 3.000 - 4.000 kg and only 1.16% of babies having birth weight above 4kg. Also it can be seen that 73.82% deliveries were occurred within the pregnancy period of 37-39 weeks and 0.64% of deliveries occurred below the pregnancy period of 32 weeks.

It is observed that out of total births occurred, 14.22% of infants had a low birth weight of less than 2.5 kg and it is more in the mother's age group 25-29 (4.84%), followed by the age group 20-24 and 30-34. It is also observed that highest percentage of babies (46.45%) have the weight of 3.000-4.000 kg and in this category, it is more in the mothers age group 25-29 (17.72%).

Analysis of Vital Rates

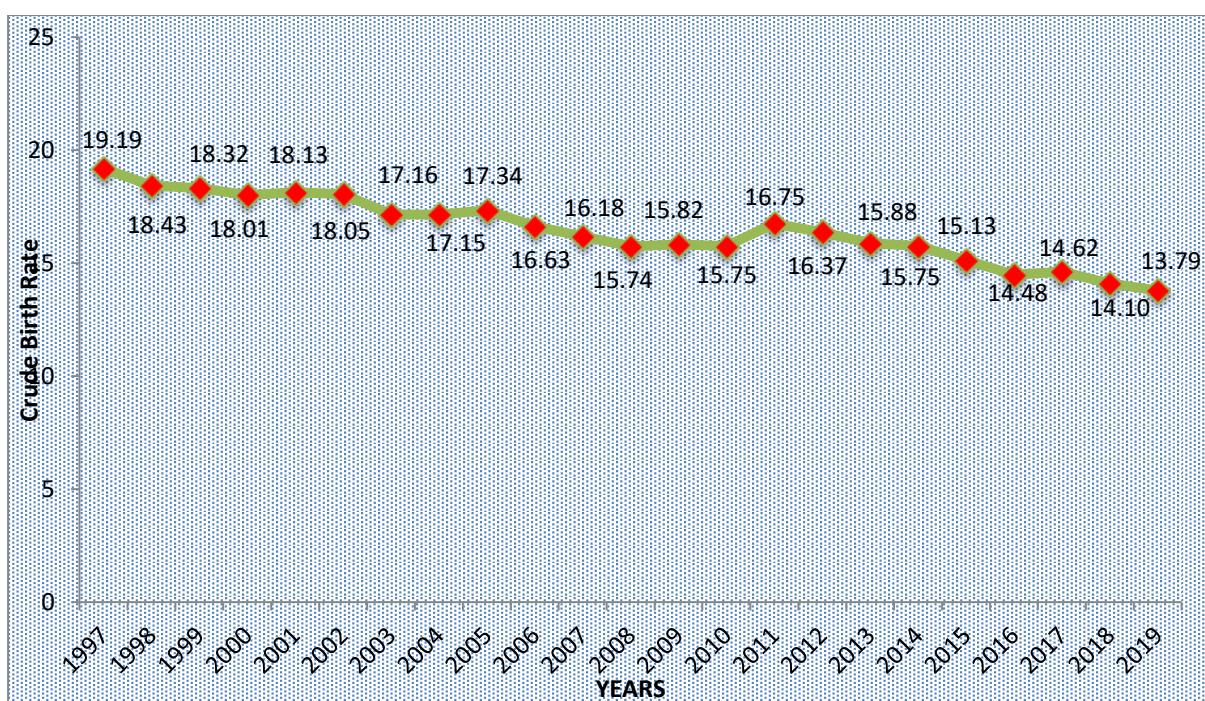

6.1 Sex Ratio at Birth (SRB)

The Sex Ratio at Birth is defined as the number of female live births per 1,000 male live births and it is an important indicator to map the sex differential of the population at the beginning of their life. Sex Ratio at birth for the year 2019 is 960 where as it was 963 for the year 2018. Among the districts, highest SRB has been reported in Idukki district (1005) and the lowest in Palakkad district (942).

6.2 Crude Birth Rate (CBR)

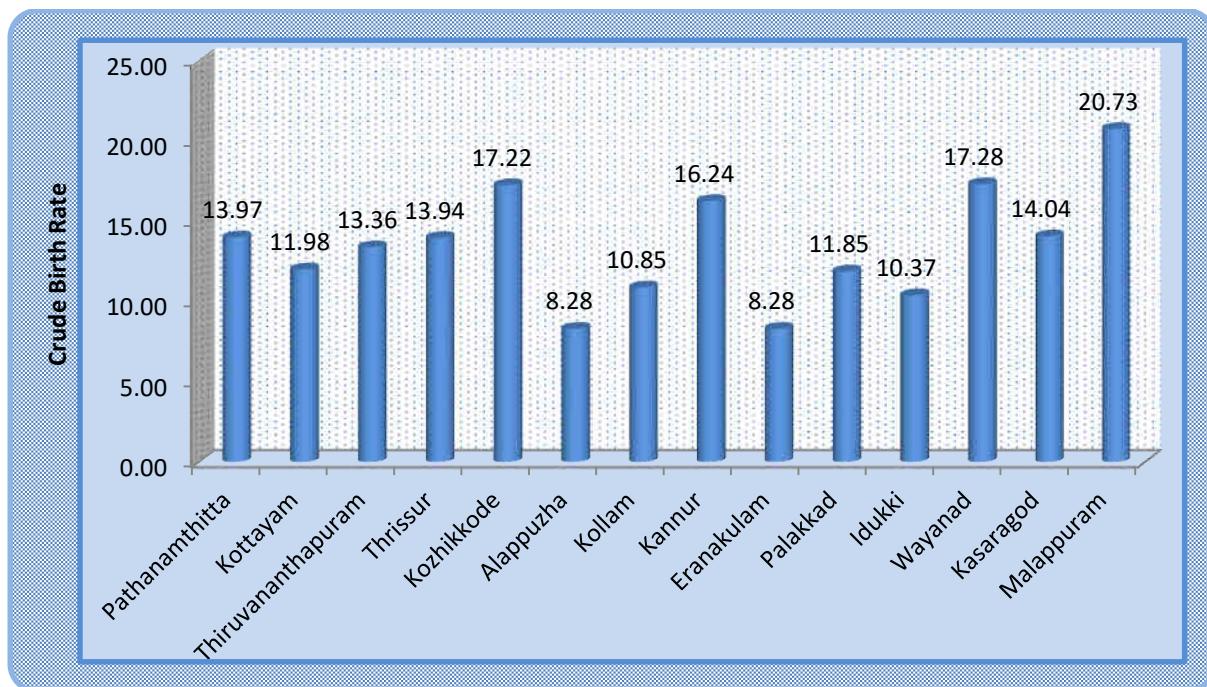

The Crude Birth Rate is the number of live births occurring among the population of a given geographical area during a given year, per 1,000 population of the given geographical area during the same year. CBR is the number of live births in a year per 1000 population and it shows the growth or decline of population in a region. During the year 2019, the CBR is 13.79, whereas it was 14.10 during 2018, which shows a marginal decrease of 0.31. Generally, Crude Birth Rate in the State shows a decreasing tendency. A declining trend has been observed in the CBR during 1997-2019 from the chart below.

Chart-6.2(i)-Trend in Crude Birth Rate –Kerala (1997-2019)

The graphical representation of birth rate of districts in the State during the year 2019 is depicted in the following chart-6.2(ii). The District wise analysis of the vital events shows that the highest birth rate was recorded in respect of Malappuram district (20.73), followed by Wayanad (17.28,) Kozhikode (17.22) and the lowest in Ernakulum & Alappuzha (8.28) districts.

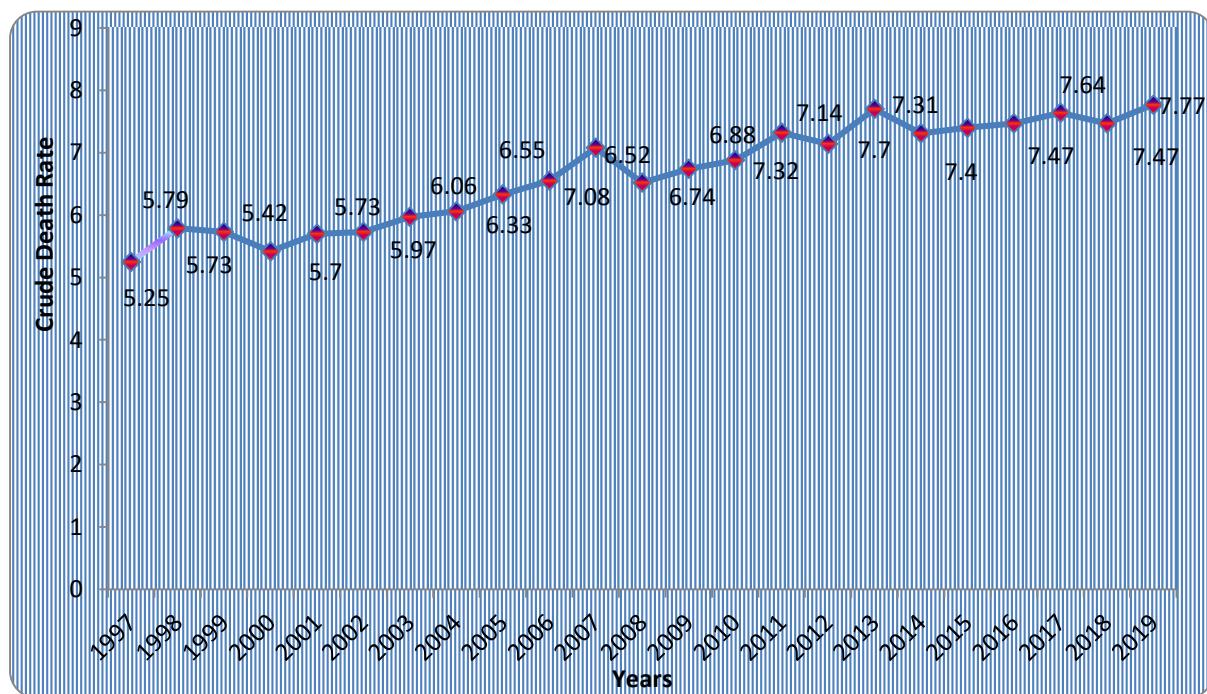

Chart 6.2(ii):- District wise Birth Rate – 2019

6.3 Crude Death Rate (CDR)

Crude Death Rate (CDR) is the total number of deaths per year per 1,000 population. The Crude Death Rate (CDR) of the State during past 23 years is presented in the chart given below. From this chart, it is observed that the CDR was 7.32 in 2011 and it increased to 7.77 in 2019.

6.4 District Wise Death Rate

District wise death rates are shown in the chart below. Among the districts the highest death rate 10.95 was recorded in Pathanamthitta followed by Kottayam (10.61) and the lowest in Malappuram (4.93)

Chart-6.4- District Wise Death Rate 2019

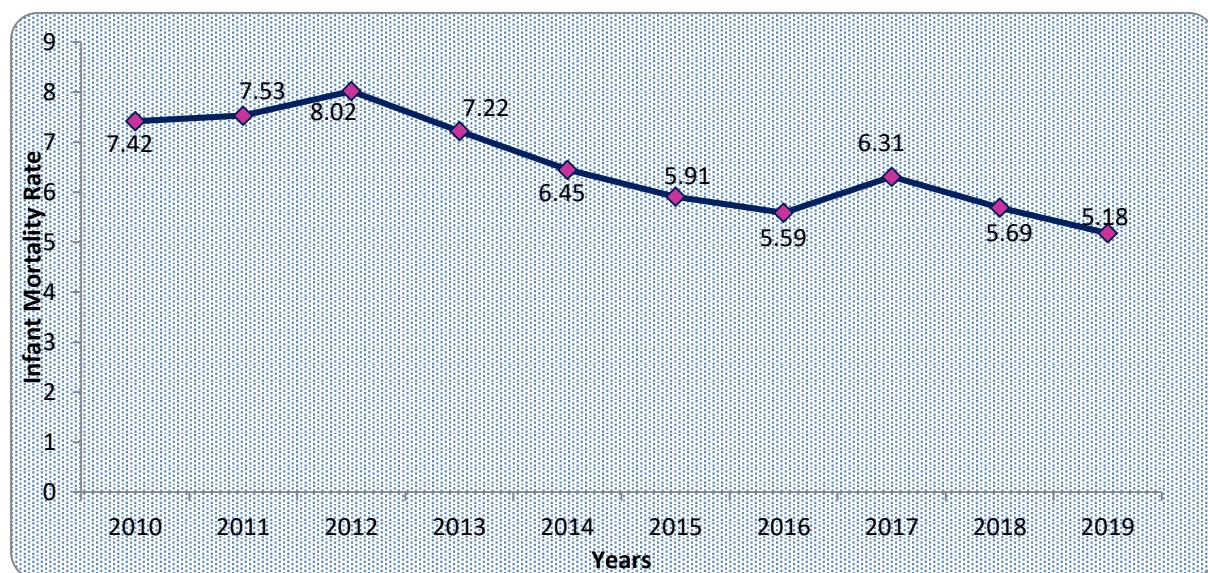

6.5 Infant Mortality Rate (IMR)

Infant Mortality Rate is defined as the infant deaths (deaths of a child less than one year old) per thousand live births. Infant mortality rate is a widely used indicator as it provides valuable insights into the health infrastructure and health status of a country.

Infant Mortality of the State during 2019 was 5.18 where as it is 5.69 during 2018. IMR of the state during the past 10 years is given in the chart. It is evident from the chart that IMR has decreased from 7.42 in 2010 to 5.18 in 2019.

Chart-6.5-Infant Mortality Rates (2010-2019)

6.5.1 Infant Mortality Rate-District wise

The Table 6.5.1 given below presents the District wise and Sex wise Infant Mortality Rate for the year 2019. Among the districts, it varies from 1.83 in Kollam & Kasaragod to 10.93 in Kozhikode. It is seen that IMR of Male is higher than female in all districts except in Kollam, Idukki & Thrissur.

6.6. Maternal Mortality Ratio (MMR)

Maternal Death means death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. Maternal Mortality Ratio (MMR) is defined as the ratio of the number of maternal deaths during a given time period per 1,00,000 live births during the same time period. The MMR is used as a measure of the quality of a health care system.

Maternal Mortality Ratio at state level for the year 2019 was computed as 23 where as it was 30 during 2010.

Chart 6.6. Maternal Mortality Ratio (MMR)-(2010-2019)

6.7 Still Birth Rate (SBR)

The World Health Organization (WHO) defines a still birth as a baby born with no signs of life at or after 28 weeks' gestation. SBR is estimated as the ratio of number of still births per one thousand live births and still births during the year.

The SBR came down to 4.10 in 2019 from 4.50 in 2018.

Chart 6.7 Still Birth Rate (SBR)

6.7. Conclusion

It is worthwhile to mention that CRS is the only source, which can provide vital rates below state level. Even though cent percentage registration has attained in the case of births, under registration of deaths still exist. Level of registration of maternal deaths and infant deaths are comparatively better. There is also need to correctly identify the maternal deaths for estimating the vital indicator MMR. All events of maternal deaths and infant deaths has to be registered to ensure accuracy of rates such as IMR, MMR etc., which are essential for health planning. Hence more care should be given to the proper implementation and monitoring of Civil Registration System.

DEFINITIONS USED IN THIS REPORT

1. **Sex ratio** is defined as the number of females per 1000 males in a population

$$\text{Sex Ratio} = \frac{\text{Number of females}}{\text{Number of males}} \times 1000$$

2. **Sex Ratio at birth** = $\frac{\text{Number of female birth registered during the year}}{\text{Number of male birth registered during the year}} \times 1000$

3. **Masculinity proportion** is the proportion of males in the total population.

$$\text{Masculinity proportion} = \frac{\text{Number of males in the Mid year population}}{\text{Total Mid year population}} \times 1000$$

4. **Aged – Child ratio** indicates whether or not a population is young or ageing

$$\text{Aged child ratio} = \frac{\text{Population of above 60 years}}{\text{Population of below 15 years}} \times 100$$

5. (**Total**) **Dependency ratio** is an age-population ratio of those typically not in the labour force (the dependent part) and those typically in the labour force (the productive part). It is used to measure the pressure on productive population. The dependent part usually includes those under the age of 15 and over the age of 64. The productive part makes up the population in between, ages 15 – 64. It is normally expressed as a percentage. The (**total**) dependency ratio can be decomposed into the **child dependency ratio** and the **aged dependency ratio**.

$$\text{Total dependency ratio} = \frac{(\text{Population of 0-14 years} + \text{Population of above 65 years})}{\text{Population of 15-64 years}} \times 100$$

$$\text{Young (child) dependency ratio} = \frac{\text{Population of 0-14 years}}{\text{Population of 15-64 years}} \times 100$$

$$\text{Old (aged) dependency ratio} = \frac{\text{Population of above 65 years}}{\text{Population of 15-64 years}} \times 100$$

6. **Crude Birth Rate (CBR)** is the number of live births in a year per thousand of population.

$$\text{Crude Birth Rate} = \frac{\text{Number of Live births during the year}}{\text{Mid-year population}} \times 1000$$

- 7. General Fertility Rate (GFR) is the total number of live births per 1,000 women of childbearing age (ages 15 to 49 years old) in a year.**

$$\text{General Fertility Rate} = \frac{\text{Number of live births in a year}}{\text{Mid-year female population in the age group (15-49) years}} \times 1000$$

8. **Age Specific Fertility Rate (ASFR)** is the number of live births per 1,000 women in a particular age groups (usually age 15-19, 20-24 etc.)in a year

$$\text{Age Specific Fertility Rate} = \frac{\text{Number of live birth in a particular age group}}{\text{Mid-year female population of the same age group}} \times 1000$$

- 9. Total Fertility Rate (TFR)** may be defined as average number of children that would be born to a woman if she experiences the current fertility pattern throughout her reproductive span (15-49 years).

$$\begin{aligned}
 &= (\text{Sum of age specific fertility rates over different age groups}) \\
 &\quad \times (\text{Width of age group}) / 1000 \\
 \text{Total fertility rate} &= 5 \times \sum_{\substack{45-49 \\ 15-19}} \text{ASFR} \\
 &= \frac{1000}{}
 \end{aligned}$$

- 10.** **Gross Reproduction Rate (GRR)** is the average number of daughters that would be born to a woman (or a group of women) if she survived at least to the age of 45 and conformed to the age-specific fertility rate of a given year. It is often regarded as the extent to which the generation of daughters replaces the preceding generation of females.

$$\text{Gross reproduction rate} = \frac{5 \times \sum_{15-19}^{45-49} \text{ASFR for female live births}}{1000}$$

11. Child-woman ratio is the number of children aged 0 to 4 per 1,000 women of childbearing age. It is used as an index of fertility when reliable birth statistics are not available.

$$\text{Child-women ratio} = \frac{\text{Population of (0-4) age group}}{\text{Female population in the age group of (15-49)}} \times 1000$$

12. Crude Death Rate (CDR) is the total number of deaths per year per 1000 people

$$\text{Crude death rate} = \frac{\text{Number of deaths during the year}}{\text{Mid-year population}} \times 1000$$

13. Infant Mortality Rate (IMR) is the number of deaths of children less than 1 year old per 1000 live births.

$$\text{Infant mortality rate} = \frac{\text{Number of infant deaths during the year}}{\text{Number of live births during the year}} \times 1000$$

14. Neo-natal Mortality Rate (NMR) is the number of deaths during the first 28 completed days of life per 1,000 live births in a given year or period. **Neo-natal deaths** may be subdivided into **early neo-natal deaths**, occurring during the first seven days of life, and **late neo-natal deaths**, occurring after the seventh day but before the 28 completed days of life. **Post neo-natal mortality rate** is the number of deaths after 28 days of life but before one year per 1,000 live births in a given year or period. **Perineo-natal mortality rate** is the number of deaths between the fetal viability (22 weeks gestation) and the end of the 7th day after delivery per 1,000 live births in a given year or period.

<i>Early neo-natal mortality rate</i>	<i>Number of infant deaths < than 7 days during the year</i>

<i>Peri neo-natal mortality rate</i>	<i>Number of still births and infant deaths of < than 7 days during the year</i>	
=	-----	X 1000
	<i>Number of live births and still births during the year</i>	

15. Still Birth Rate (SBR) is the number of fetal deaths (still births) per 1,000 live births plus fetal deaths (still births).

<i>Still birth rate</i>	<i>Number of still births during the year</i>	
=	-----	X 1000
	<i>Number of live births and still births during the year</i>	

16. Maternal Mortality Ratio (MMR) is the number of maternal deaths per 100000 live births.

<i>Maternal Mortality Ratio</i>	<i>Number of Maternal Deaths during the year</i>	
=	-----	X 100000
	<i>Number of live births during the year</i>
