# PREFACE

**C**ivil Registration System is a continuous, permanent and compulsory recording of the occurrence and characteristics of vital events like Births, Deaths and Still Births. The main objective of the Civil Registration System is to record the annual change in population at National and State Level between two successive decennial Censuses. The registration of births and deaths has been made statutory through Registration of Births and Deaths Act 1969, which came into force in the State on 1<sup>st</sup> April 1970 vide Government of India Gazette Notification dated 21<sup>st</sup> March 1970 along with many other States.

The registering authorities at the local bodies are Secretaries of Grama Panchayats, Health Inspectors of Municipalities, Health Officers of Corporations and the Executive Officer of Kannur Cantonment. This report titled "Annual Vital Statistics Report 2020" provides an overview of the working of the Civil Registration System (CRS) in the state and presents a compilation of data on registered births, deaths, infant deaths and still births with rural-urban & sex-wise break-up based on Civil Registration Records.

The report was prepared by the Vital Statistics division of this office. The sincere efforts put in by Smt. Sindumol K.G, Statistical Assistant Gr.I, & Sri. Sabu B, Smt. S.A. Suma, Research Assistants and the timely advice and guidance given by Sri. C. Madhavan, Deputy Director, Vital Statistics Division to bring out this publication is very much appreciated.

I would like to place on record my appreciation for the co-operation and valuable services rendered by the IKM, Local Registrars, District Registrars, Deputy Directors and staff of the District Offices of Economics & Statistics for bringing out this publication.

I hope that this report would immensely benefit to those who work in the Health sector and Researchers in the field. Suggestions for further improvement of the report will be highly appreciated.

# CHAPTER - 1

## The Civil Registration System in Kerala – Introduction

Registration of Births and Deaths is an important source for demographic data for socio-economic development and population planning. In India, the need for dependable demographic data was felt soon after independence heralding the era of Five Year planning. In the beginning, the registration of births and deaths started on voluntary basis and there was no uniformity in statistical returns resulting in both under registration and incomplete coverage. In order to unify the civil registration activities, the Civil Registration System (CRS) was introduced in India under the Registration of Births and Deaths Act (RBD Act), 1969. Civil Registration System may be defined as a continuous recording of vital events such as births, deaths and marriages occurring in a population. The basic uses of data from Civil Registration System are:

- Maintenance of permanent records on births and deaths as legal documents.
- Assessment of continuous changes in population.
- Evaluation of success of socio-economic programmes by indicators based on vital events and size of population.

As a matter of fact, requirement of this system as legal proof of births and deaths should in itself be strong enough reason for any country to have a fully operational CRS. In India the registration of vital events and the administrative machinery for this purpose has been in existence for more than a century. It had been working under diversified Acts and executive instructions thus making it unsuitable for the independent India.

### 1.1 Registration of Births and Deaths Act 1969

This Act replaced the then existed laws and unified the system of registration throughout the country. Under the RBD Act 1969, registration of births and deaths is made compulsory. It has become mandatory on the part of head of house hold or his representative to report and register domiciliary vital events, for medical officers in charge of medical institution in respect of births and deaths occurring in these institutions. The Act also provided the statutory authority at Centre, State, District and local level. It prescribed definitions, principles, personnel and penalties connected with enforcement of the Act. It enabled Central Government to insist uniformity in registration procedures and bring out comparability in vital statistics registered in different parts of the country.

Statistics of births and deaths are compiled on the basis of Civil Registration System introduced under the Registration of Births and Deaths (RBD) Act, 1969. It is required under the Act that each vital event should be reported within 21 days from the date of occurrence of the event. This Act also provides for registration of events beyond 21 days on payment of some penalty. In the case of large delays, registration can only be done after taking the permission of the District Magistrate.

### **National Level**

At national level the Registrar General of India (RGI) administers the CRS. He is empowered to issue general directions and take steps to co-ordinate and unify the activities of Chief Registrars of the States, who are the Chief Executive authority in the states for executing the provisions of RBD Act 1969 and the rules and orders made there under. They were responsible for coordinating, unifying and supervising the work of CRS within their respective State.

### **State Level**

The Registration of Births and Deaths Act 1969 (Central Act 18 of 1969) came into force in Kerala on 1<sup>st</sup> April 1970 by the Government of India Gazette notification dated 21<sup>st</sup> March 1970 along with many other states. The Kerala Registration of Births and Deaths Rules 1970 published in G.O.(P)No.7/70/LAD dated 29<sup>th</sup> June 1970 by S.R.O.No.262/70 Gazette dated 1<sup>st</sup> July 1970 have been approved by the Government of India under section 10(1) of the said Act.

As per the circular No.6/4/97/VS (CRS) dated 31/5/1999 of the office of the Registrar General of India, the revamped Civil Registration system was introduced with effect from 01/01/2000. In tune with the newly introduced system, the Registration of Births and Deaths Rules 1970 was replaced with the new rules, viz Kerala Registration of Births and Deaths Rules 1999 and it was published as per the order G.O.(P)No.8/2000/LSGD dated 06/01/2000.

## **1.2 Organizational Setup in the State**

- **Chief Registrar**

The Joint Director of Panchayats, Government of Kerala is the Chief Registrar of Births and Deaths.

- **Additional Chief Registrar**

The Additional Director (General) of Economics and Statistics Department is designated as the Additional Chief Registrar of Births and Deaths.

- **Deputy Chief Registrar**

Deputy Chief Registrar assists the Chief Registrar in the day-to-day affairs relating to the registration of Births and Deaths at the State level. Deputy Director of Economics and

Statistics, Vital Statistics division has been designated as Deputy Chief Registrar to assist Additional Chief Registrar to release timely birth & death statistics.

- **District Registrars**

The Deputy Director of Panchayats of the 14 districts in the State are functioning as the District Registrars. The Secretaries of Corporations, Municipalities and the Executive Officer of Kannur Cantonment area are exercising the powers of District Registrars.

- **Additional District Registrars**

The Deputy Directors of the 14 District Statistical Offices are functioning as the Additional District Registrars of Births and Deaths of respective revenue districts.

- **Registrars**

The Secretaries of Grama Panchayats, Health Officers of Corporations, Health Inspectors of Municipalities and Executive Officer of Kannur Cantonment area are functioning as the Registrars of births and deaths.

### **1.3 The Process**

The data reporting forms contain details of birth, death and still birth. Birth registration form contains information on date of occurrence/registration, usual residence of mother, place of birth, sex and weight of the child, order of birth, type of medical attention at birth, type of delivery and characteristics of the parents including their name, age, religion, educational status, occupation etc. In the case of death, information includes name, sex, age, marital status, religion, occupation, usual residence of the deceased, place of occurrence, date of occurrence/registration, cause of death, whether medically certified or not and kind of medical attention received at the time of death and characteristics of the mother, pregnancy period etc. in the case of still births. These forms have two parts: legal and statistical. The statistical part of the vital events registered in the registration units are entered in to the Sevana software developed by IKM, Kerala. The Vital Statistics Division of the DES prepares this report as per the methodology and instructions issued by the Registrar General of India (RGI) from time to time. The report contains district-wise statistics of births, deaths, infant deaths, still births and the related vital rates.

### **1.4 Limitations of the Data**

As far as the level of registration, Kerala has attained cent percent record in the registration of births and 99.5 percent in the case of deaths. Some events are seen unregistered. This may be due to lack of awareness about the need and importance of registration of births and deaths and lack of registration procedure knowledge among the public. This may affect the quality of the statistical data. Efforts are being taken to create awareness about the importance and necessity of registration. More over Cochin Corporation was not sharing data through IKM (Sevana Software)

during the year under report and hence from Cochin Corporation's data not included in this report for calculating Vital Rates & and also Detailed Tables.

### **1.5 Status of Reporting**

The local bodies, viz., the Grama Panchayats, Municipalities and Corporations function as the registration units of vital events in the State. Place of Occurrence of events and Year of Registration are the criteria used in the report for compiling vital events. Total Registration units in the State are 1035 units. The details of registration units (Rural& Urban) are given in table A1. Utmost care has been given for the above process avoiding duplications and omissions, and eventually a cent percent reporting was achieved both in rural as well as urban areas.

## Analysis of Vital Events – Live Births

### 2.1 Registered Live Births

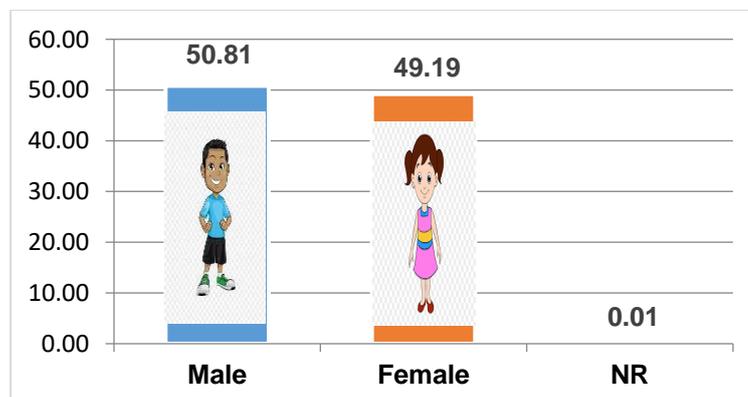

Total number of live births registered during the year 2020 was 446891. Out of the total live births registered, 227053 are male births, 219809 are female births and the remaining 29 cases are not reported its sex. It is seen that more males (50.81%) were born than females (49.18%) which resulted to a sex ratio at birth of 968 females per 1000 males.

The following Table 2.1(i) shows the registered live births by sex. Also the chart 2.1(i) presents the pictorial presentation of percentage of live births registered by sex.

**Table- 2.1(i)**  
**Registered Live Births by Sex –2020**

Sex	No. of Births registered	%
Male	227053	50.81
Female	219809	49.18

<b>Total</b>	<b>446891</b>	<b>100.00</b>

**Chart 2.1(i) - Percentage Distribution of Registered Live Births by Sex –2020**

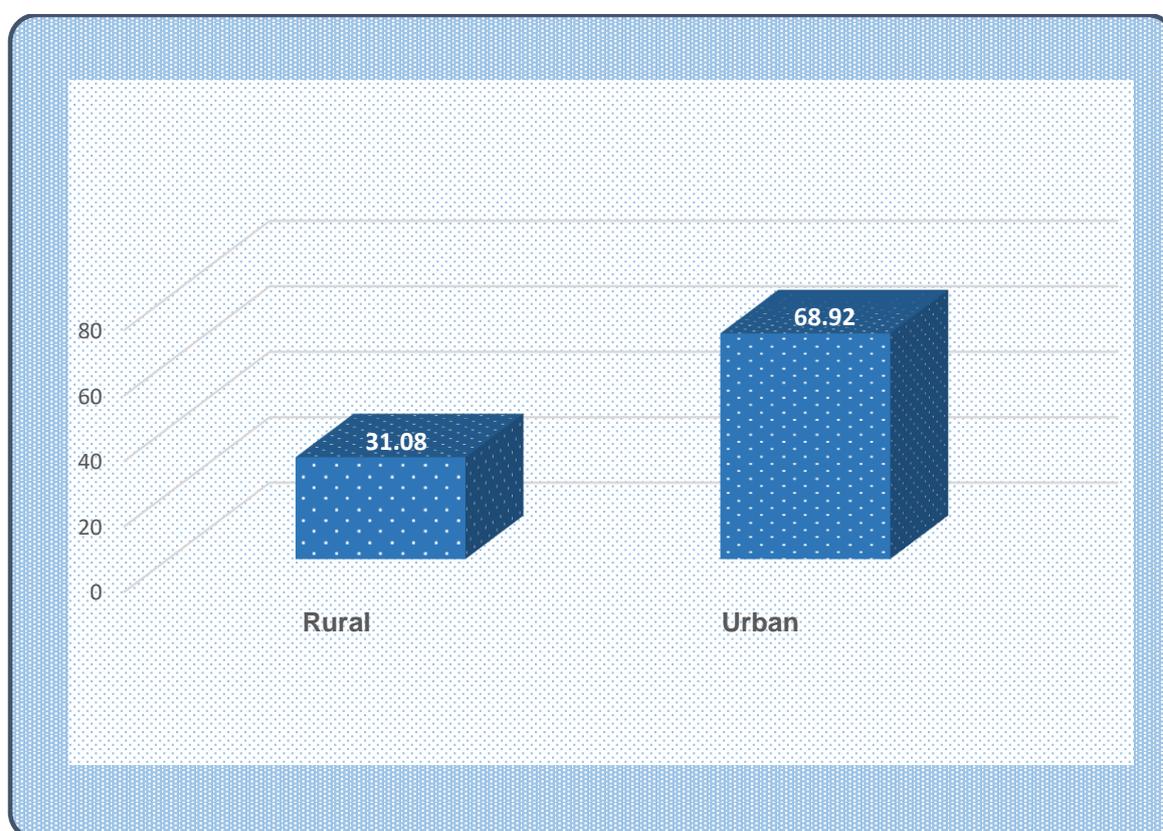

According to the number of live births registered by area, 138910 births (31.08%) were reported from rural areas and 307981 births (68.92%) from urban areas. The following Table 2.1(ii) shows the percentage of area wise registered live births and the chart 2.1(ii) shows the pictorial presentation of percentage of live births registered by area. It is observed that the percentage share of live births registered in rural area is lower than that of urban area.

## 2.2 Time Gap in Registration of Birth

The registered births have been classified in four categories depending upon their period of registration. The four time periods considered for the purpose are: i) within prescribed time limit ( up to 21 days), ii) After 21 days but within 30 days, iii) After 30 days but within 1 year, iv) More than 1 year. Under the RBD Act 1969, all vital events are to be registered within 21 days from the date of occurrence of the event. Even though there exists a system of birth registration at the place of delivery (hospital) through the institution concerned, there were delayed registrations still prevails. The percentage of registration achieved out of total registration undertaken in the year 2020 within the prescribed time limit (up to 21 days) is 75.22%. As per area wise, it is 67.95% in rural area and 78.50% in urban areas. During the year 2020, 24.78% births registered were reported as delayed registration. In the case of rural area, it is 32.05%, where as in urban area, delayed registration reported is 21.50%. District wise details of time gap in registration of live births are given in Table B3(i), B3(ii) and B3(iii).

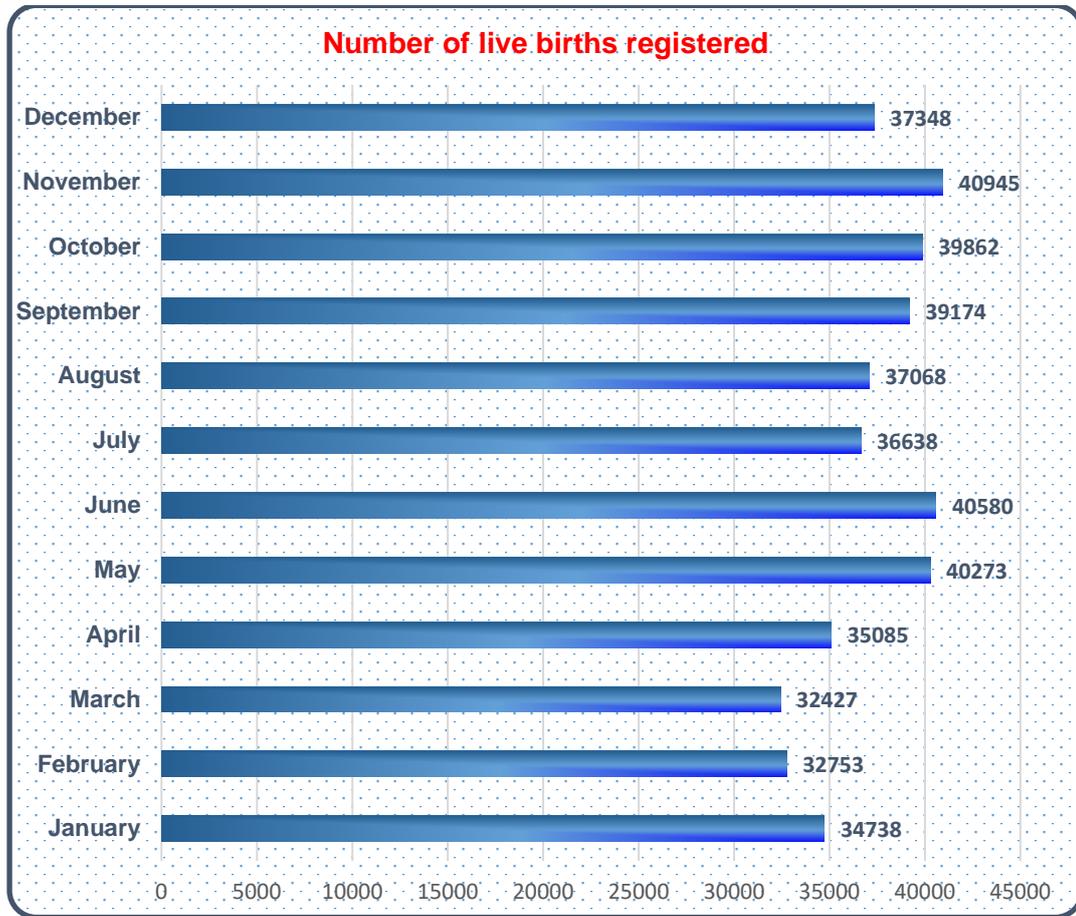

## 2.3 Live births by month wise Registration

In 2020, highest number of births registered in November with 40945 (9.16%) of the total births in the State. It was followed by the months of June (9.08), May (9.01%) & October (8.92%). The month of March (7.26%) had the least number of births registered in 2020. The month wise live births registered during 2020 are shown in the following table 2.3 and chart 2.3

**Table – 2.3**

#### **2.4 Sex Ratio at Births by Month and Districts wise**

The Sex Ratio (Number of females per thousand males) at birth is an important indicator to map the sex differential of the population at the beginning of their life. The sex ratio at birth has been calculated by moth and district wise for the year 2020 is shown below in the following table 2.4(1) & 2.4(2) while analyzing the month wise Sex Ratio at birth, the highest Sex Ratio at birth reported during the month of October and the lowest during the month of September. In the case of district wise births reported, it is seen that sex ratio at birth is highest in Wayanad followed by Kollam and Idukki and the lowest in Alappuzha district. Chart 2.4(i) & 2.4(ii) gives the pictorial presentation of sex ratio at birth by month wise & district wise.

## 2.5 Medical attention received at the time of delivery

The percentage distribution of medical attention received at the time of delivery has been given in the following table 2.5(i). The data shows that majority of births have been occurred in an institution, either in Government or private hospitals. Out of total births registered during 2020, Institutional births occurs in 99.24% of cases, 0.20% of the cases were attended by Physicians/Nurse/Midwife. However, about 0.31% of the events were still attended by traditional birth attendant and another 0.22% by Relatives and others.

**Table – 2.5(i)**

The following Table 2.5(ii) represents the percentage distribution of live birth by type of medical attention received at the time of delivery in rural/urban area separately. It is seen that out of 138910 live births in rural area, 97.86 % events are reported as institutional birth and in the case of urban area, the corresponding rate is 99.86%.

In spite of having enough medical facilities across the State, a small percentage of live births (0.89) is still attended by traditional birth attendant/relatives in rural area and 0.04% in urban area.

## 2.6. Live birth by Type of institution and Method of delivery

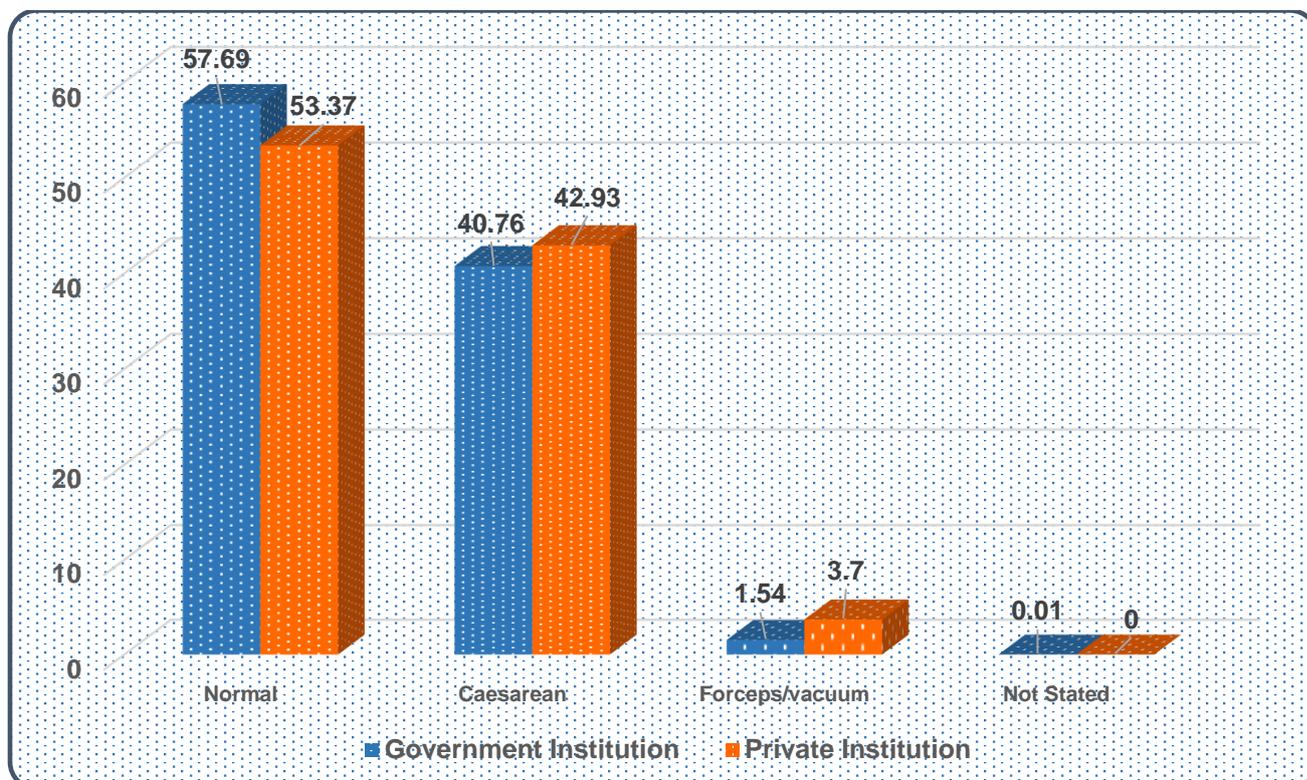

Delivery or childbirth can be categorized on the basis of place of delivery, type of delivery (normal/caesarean section) and the personnel conducting delivery. These factors affect the chances of survival and subsequent health of mother and child.

The following Table 2.6 gives the percentage distribution of registered live births occurred in institutions by method of delivery. During 2020, the percentage share of institutional deliveries to total live birth is 99.24%. While considering the institutional wise, it is seen that out of the 135571 Live births occurred in Govt. Hospitals, 57.69% are normal deliveries and 40.76% are caesarians. But in the case of private hospitals, out of 307903 live births occurred, the percentage of normal deliveries and caesarians are 53.37% and 42.93% respectively. It is also noted that in both the type of institutions, percentage of normal deliveries are more than that of caesarian. The pictorial presentation of percentage distribution of institutional live births by method of delivery is given in the following charts 2.6(i), 2.6(ii) & 2.6(iii).

## 2.7. Live birth by method of delivery and age of mother

The following Table 2.7 presents the Percentage distribution of live birth by method of delivery and age group of mother. As per the percentage of live birth registered by type of attention at delivery, 54.96% are normal deliveries and 42% are of Caesarean. The highest percentage of live births (36.45%) belongs to mothers in the age group 25-29, followed by the age group 20-24. In addition to this, highest percentage of normal (19.64%) as well as caesarean (15.75%) deliveries are also belongs to the 25-29 age group.

**Table – 2.7**

## 2.8. Live births by age of mother and birth order

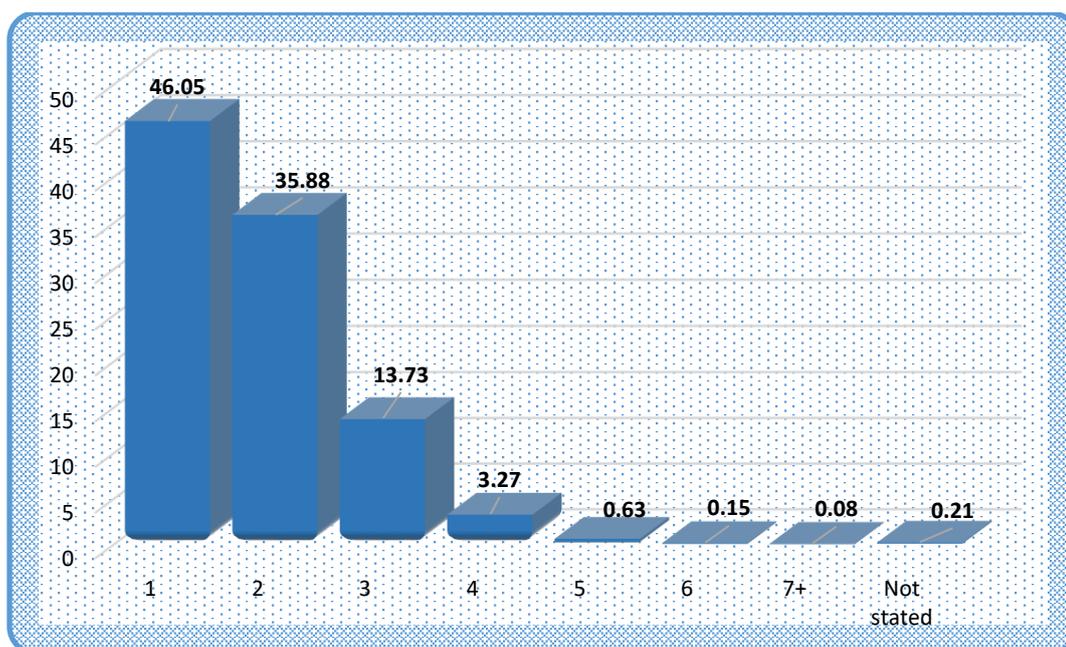

Table 2.8 below presents the distribution of live births by age of mother and birth order. In the reproductive age group of 15-49, highest number of live births were reported for the mothers in the age group of 25-29(36.45%), followed by the age group 20-24 (31.90%) and there after it declined gradually with increase in age.

### 2.9. Live births by Educational level of mother and father

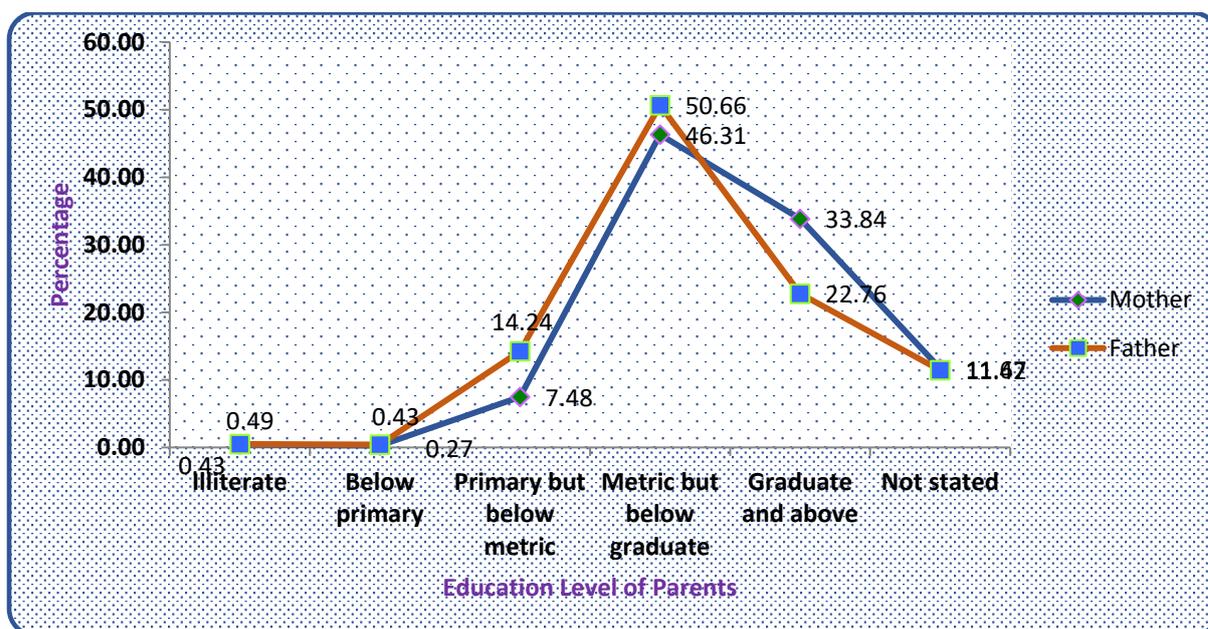

Table 2.9 shown below the percentage distribution of live births according to the level of education of father and mother. While considering the educational level of mother, highest percentage of birth registered is in the category “Metric but below graduates”, followed by “Graduate and above” and there after “Primary but below metric”. In the case of educational level of father also, the same pattern is following. In both the case of educational level of mother and father, percentage is very small in all other categories.

### 2.10. Live birth by occupation of Father and Mother

The following table 2.10 shows the Percentage distribution of Live Birth by occupation of Mother & Father. Specific jobs like administrative, executive and managerial jobs require relatively higher educational qualification, which in turn have impact on family size. Table B16 and B17 gives the details of Live birth by occupation of Mother & Father.

## 2.11. Live birth by duration of marriage and birth order

Following Table 2.11 presents the percentage distribution of live birth by duration of marriage of mother and birth order. It reveals that 53.48% of births were occurred to young couples having duration of marriage 0-4 years and 30.32 % of live births within 5-9 years after marriage. Obviously higher proportion of births (41.19%) was of first order for the young couples having duration of marriage 0-4 years.

## 2.12. Live births by duration of pregnancy and birth weight

One of the important causes of still birth and infant death is due to premature delivery. Again premature babies having low birth weight (less than 2.5kg) are susceptible to diseases. Out of the total live birth registered during the year 2020, 14.06% were born with low birth weight. A clear association between duration of pregnancy and birth weight can be observed in the following Table 2.12. It is seen that 37.54% of babies having birth weight between 2.500-3.000 kg and 47.13% of babies having weight between 3.000 - 4.000 kg and only 1.16% of babies having birth weight above 4kg. 76.16% deliveries were occurred within the pregnancy period of 37-39 weeks and 0.65% of deliveries occurred below the pregnancy period of 32 weeks.

### 2.13. Live births by age of mother and birth weight

The following Table 2.13 presents the percentage distribution of live birth by age of mother and birth weight. It is observed that out of total births occurred, 14.06% of infants had a low birth weight of less than 2.5 kg and it is more in the mother's age group 25-29 (4.73%), followed by the age group 20-24 and 30-34. It is also observed that highest percentage of babies (47.13%) have the weight of 3.000-4.000 kg and in this category, it is more in the mothers age group 25-29 (17.78%).

## Analysis of Vital Events – Deaths

### 3.1. Registered Deaths

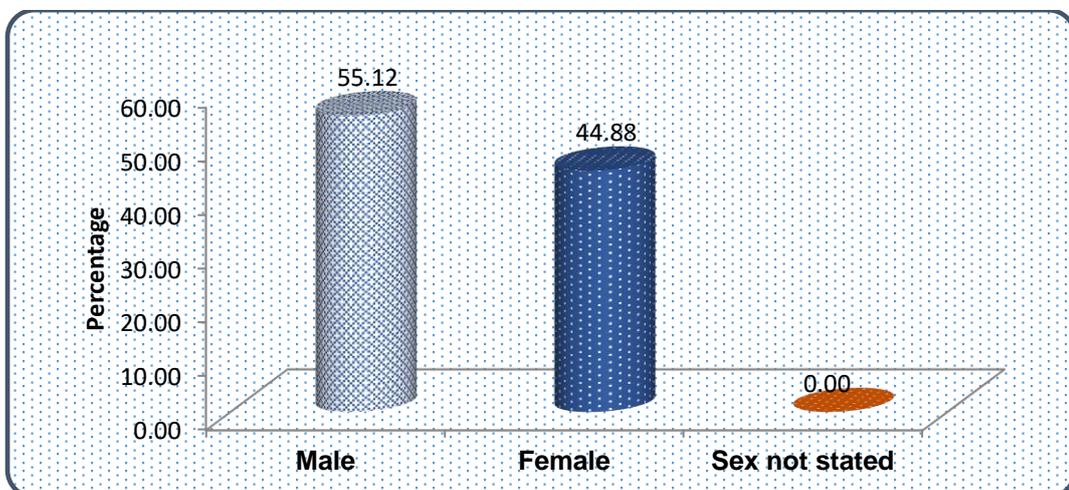

In 2020, a total of 250983 deaths were registered in the state. The following Table 3.1(i) provides the percentage distribution of registered deaths in the state by sex. Out of the total registered deaths, males constitute 55.12% (138331) and females constitute 44.88% (112640) which shows that male deaths registered during 2020 were more than that of female death.

The Rural /Urban classification reveals that out of total deaths registered during the year 2020, rural area represents 65.82% and that of urban area is 34.18%. Table 3.1(ii) shows the percentage distribution of deaths by the area of registration.

**Table - 3. 1(i)**

### **3.2. Time Gap in Registration**

During the year 2020, out of 250983 deaths registered, 138741 deaths (55.28%) were registered within the prescribed time limit (within 21 days of occurrence) and the remaining 112242 deaths (44.72%) registered after the prescribed time period. Percentage of registration within the prescribed time limits of 21 days in Rural and urban areas are 49.56% and 66.30% respectively. Similarly the percentage of delayed registration in rural and urban areas is 50.44% and 33.70% respectively. Detailed report is presented in Tables D3(i), D3(ii) & D3(iii).

### 3.3. Deaths by month of occurrence

In 2020, highest number of deaths registered in the month of November with 25306 (10.08%) of the total deaths in the State. It was followed by the months of December (9.69%), October (9.63%), and September (9.60%). The month of April had the least number of deaths registered (5.46%).

Following Table 3.3 gives the number and percentage of month wise registered deaths during 2020.

### 3.4. Medical attention received at the time of death

Table 3.4(i) and 3.4(ii) shows the percentage distribution of medical attention, received by the deceased at the time of death. It is evident from the Table 3.4(i) is that 58.59% of total registered deaths have occurred in institutions and 16.68% in Non Institutions. Out of 58.59% of institutional deaths, 32.86% of deaths were reported from rural areas and 25.73% deaths from urban areas. Similarly in the case of 16.68% of Non-institutional deaths, share of rural and urban sectors are 13.19% and 3.49% respectively. It is also seen that percentage of events in rural area is higher than that of urban area. Another feature observed is that 24.71% of deceased have not received any medical attention at the time of death.

**Table - 3.4(i)**

The following table 3.4(ii) and Chart 3.4.ii(a) and 3.4.ii (b) presents the percentage distribution of deaths by type of medical attention at the time of death for rural and urban sector separately. It is seen that out of 165186 deaths in rural areas, 49.93 per cent of deaths occurred at institutions and 20.04 per cent at non institutions. Similarly out of 85797 deaths in urban areas, share of deaths in institutions and non-institutions are 75.28 % and 10.21% respectively. Also, 30.02 per cent of deaths in rural areas and 14.48% of deaths in urban areas have no medical attention received at the time of death.

### 3.5. Deaths by age and sex

The table -3.5 given below shows the percentage of death in different age group by sex. Among different age groups, highest percentage of death (57.28%) was in the age group 70+ years followed by 15.79% in the age group 55-64 years and 11.48% in the age group 65-69 years. It can be seen that percentage of male deaths is higher than that of females in all the age groups except in 70+ age group where in this category, percentage of female deaths is higher than that of male deaths.

### 3.6. Maternal Deaths by age of Mother

Maternal Death means death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. The following table 3.6 shows the percentage distribution of maternal death during the year 2020. While considering the maternal death occurred in different age groups, it reveals that out of total maternal deaths registered, highest percentage (17.19%) of maternal deaths have been reported in the age groups “35-39” and “45+”, followed by the age group 25-29 (10.94%) & 40-44 ( 9.37% ).

### 3.7. Cause of Deaths by age and sex

The following table 3.7 presents the details of top 10 leading causes of death in the State during the year 2020. Overall, the leading cause of death is Heart attacks, followed by Asthma and Cancer. Out of 250983 deaths registered, percentage of deaths due to Heart attacks is 25.43%, followed by Asthma (8.89%), Cancer (7.98%), Paralysis (2.25%), Kidney Trouble (2.16%) & Suicide (2.07%). It can be observed that percentages of suicidal deaths are higher for males than that of females. The Percentage of registered deaths due to accident was 0.74%.

## Analysis of Vital Events – Infant Deaths

### 4.1. Registered Infant deaths

The infant deaths (death of a child less than one year old) registered by place of occurrence (Rural / Urban) of the event for the year 2020 has been given in Table 4.1(i). It may be observed that the share of rural area is 40.73% while that of urban area is 59.27% in total registered infant deaths during the year. At the state level, the percentage share of infant deaths to total deaths in the year 2020 is 0.91%

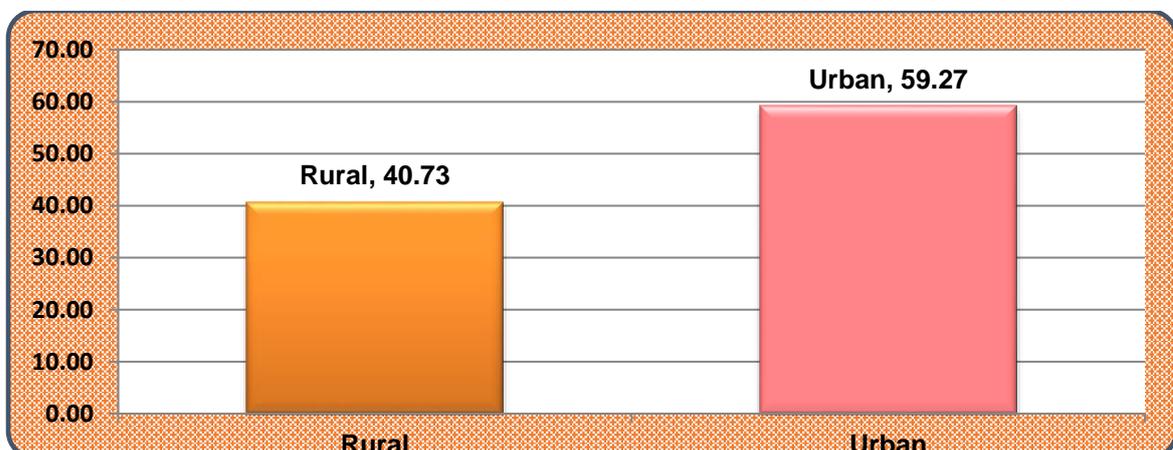

Also, the Table 4.1.(ii) shows the Percentage distribution of infant deaths by sex. It is seen that out of 2293 infant deaths, male death is 1285 (56.04%), where as that of female death is 1000 (43.61%) and the remaining 8 deaths (0.35%), sex is not reported. The share of female infant deaths in total female deaths is 0.89% while the same for male is 0.93%.

**Table-4.1(i)**

#### **4.2. Infant Deaths by age**

Percentage distribution of infant death by age group is presented below in Table 4.2. The data reveals that 58.26% of infant deaths have been occurred to the infants aged less than seven days. 19.49% of infant death belongs to the age group 7-28 days and 17.14% belongs to the age group 28 days to 6 months. Majority of infant death occurred within 7 days of age. The similar pattern could be observed in Rural and urban areas also.

## Analysis of Vital Events – Still Births

### 5.1. Registered Still births

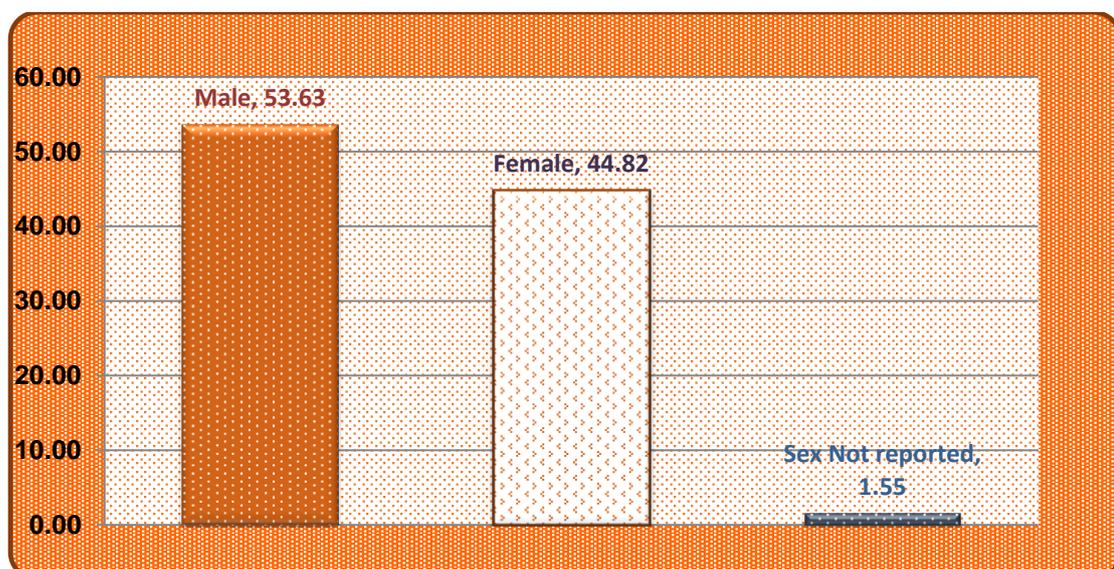

The World Health Organization (WHO) defines a still birth as a baby born with no signs of life at or after 28 weeks' gestation. During the year 2020, a total of 1803 still births comprising of 967 males, 808 female and 28 sex not reported were registered. The following table 5.1(i) shows the percentage distribution of registered still births by sex and the pictorial presentation is given in chart 5.1(i)

Also the Table 5.1(ii) given below presents the still births registered by place of occurrence (Rural / Urban) of the event for the year 2020. It may be observed that out of total registered still births, 33.89% is in rural areas and 66.11% in urban areas.

**Table - 5.1(i)**

## 5.2. Still births by age of mother

The following Table 5.2 shows the distribution of still births by age of mother at birth. It is seen that the highest percentage of still birth has been reported in the age group 25-29, followed by the age group 20-24, 30-34, 35-39 and for all other age groups, the number of still births are very low.

**Table - 5.2**

## 5.3 Still births by duration of pregnancy

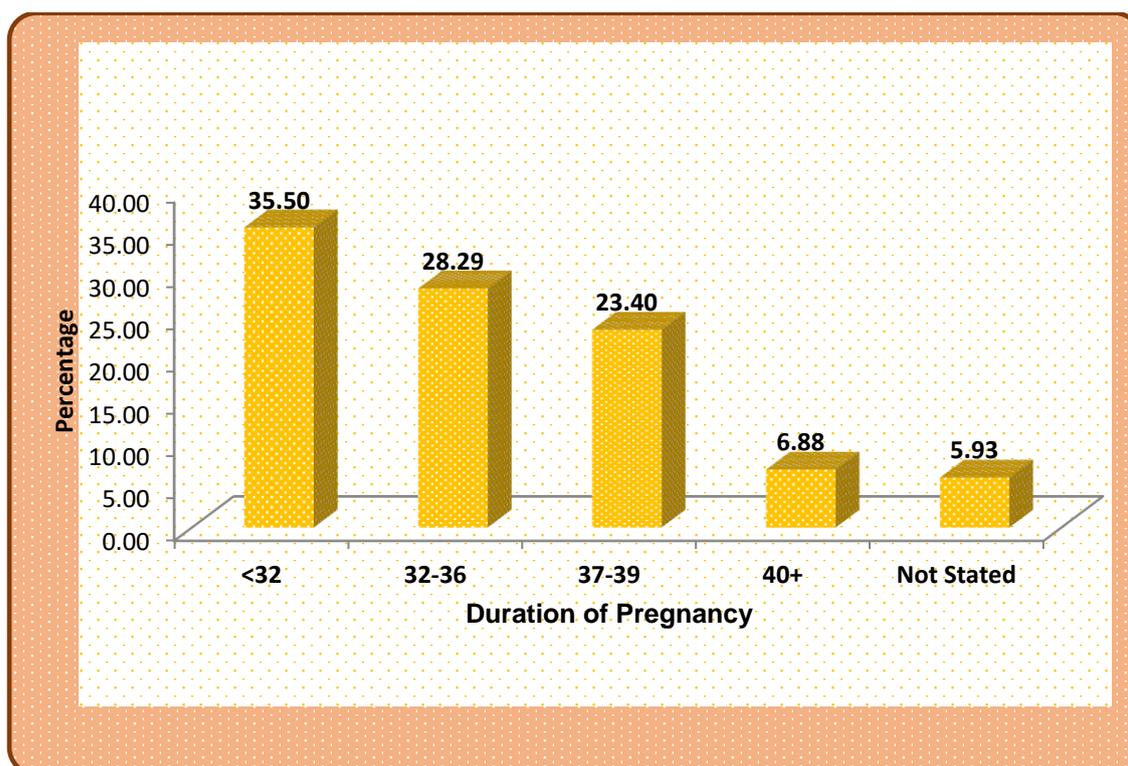

Percentage distribution of still births by duration of pregnancy is given below in Table 5.3. Highest percentage of still birth is reported under the category of pregnancy duration of less than 32 weeks(35.50%), followed by the period of 32-36 weeks(28.29%) and lowest in the pregnancy period of 40 or more weeks(6.88%). This data reveals that one of the predominant causes for still birth is due to premature delivery.

**Table - 5.3**

## Analysis of Vital Rates

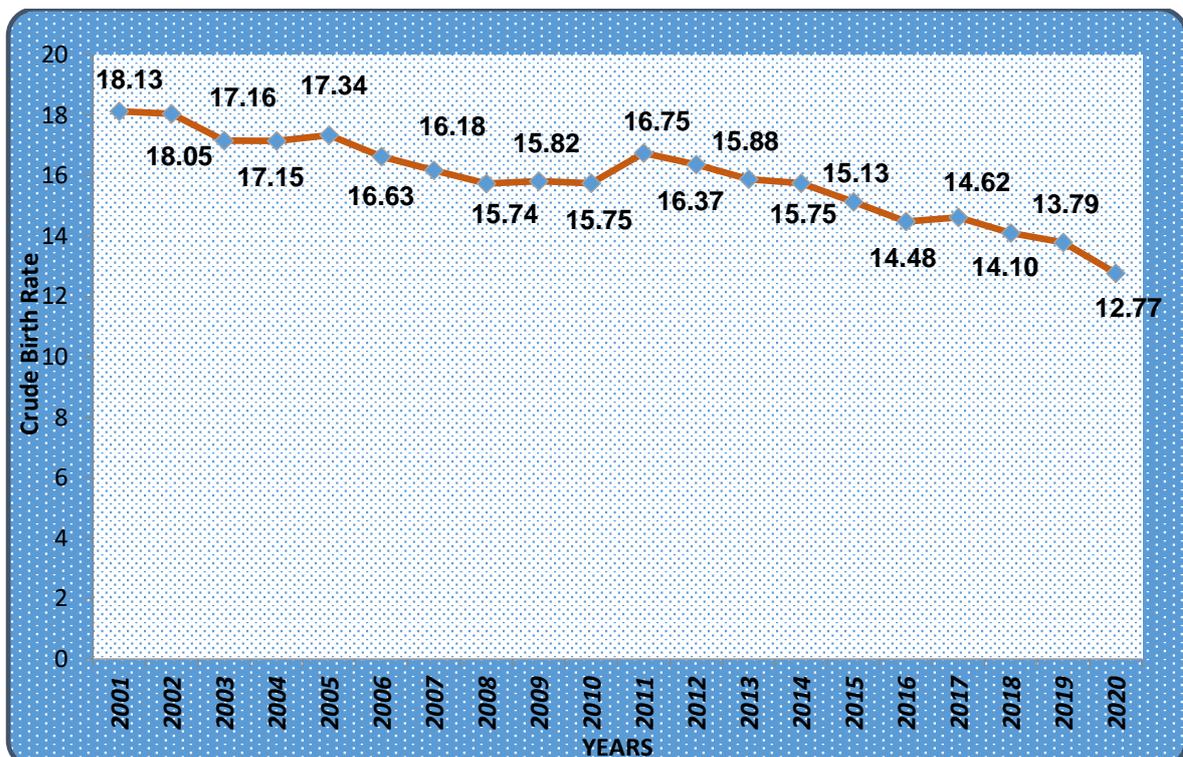

### 6.1 Sex Ratio at Birth (SRB)

The Sex Ratio at Birth is defined as the number of female live births per 1,000 male live births and it is an important indicator to map the sex differential of the population at the beginning of their life. Sex Ratio at birth for the year 2020 is 968 whereas it was 960 for the year 2019. Among the districts, highest SRB has been reported in Wayanad district (991) and the lowest in Alappuzha district (939).

### 6.2 Crude Birth Rate (CBR)

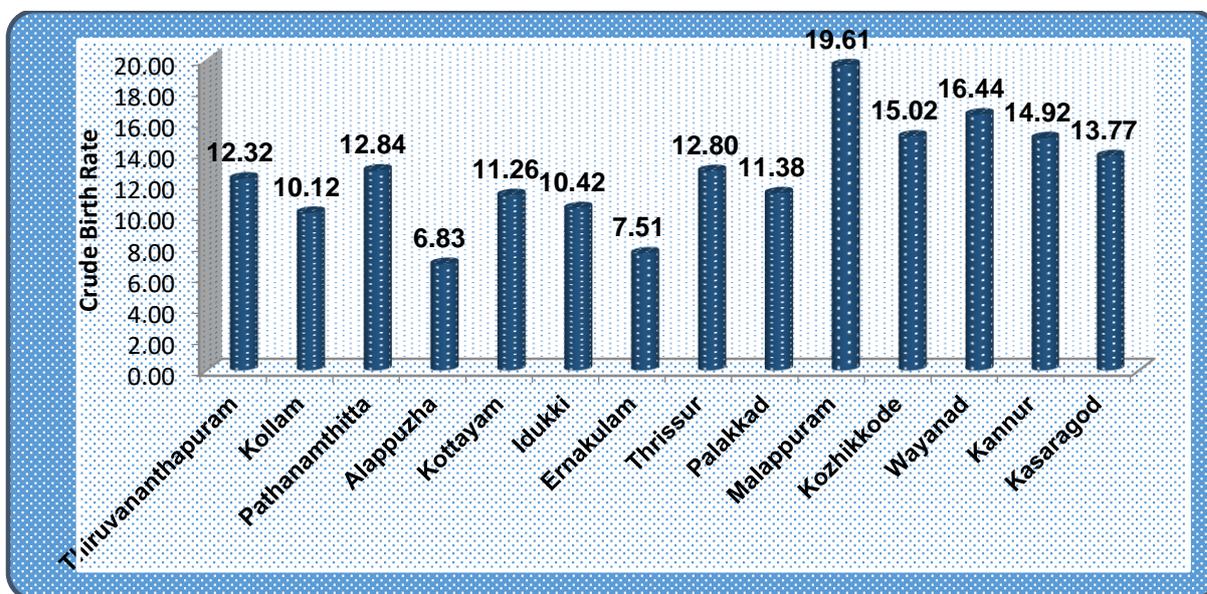

The Crude Birth Rate is the number of live births occurring among the population of a given geographical area during a given year, per 1,000 population of the given geographical area during the same year. CBR is the number of live births in a year per 1000 population and it shows the growth or decline of population in a region. During the year 2020, the CBR is 12.77, whereas it was 13.79 during 2019, which shows a marginal decrease of 1.02. Generally, Crude Birth Rate in the State shows a decreasing tendency. A declining trend has been observed from the chart given below.

Chart-6.2(i)-Trend in Crude Birth Rate –Kerala (2001-2020)

The graphical representation of birth rate of districts in the State during the year 2020 is depicted in the following chart-6.2(ii). The District wise analysis of the vital events shows that the highest birth rate was recorded in respect of Malappuram district (19.61), followed by Wayanad (16.44), Kozhikode (15.02) and the lowest in Alappuzha district (6.83).

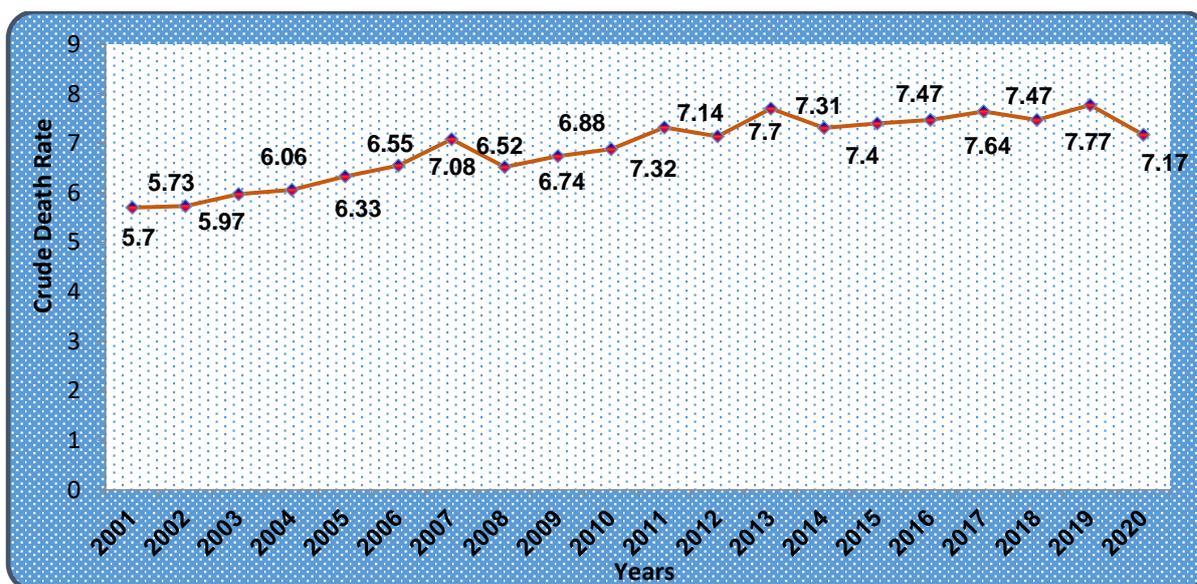

**Chart 6.2(ii):- District wise Birth Rate – 2020**

### 6.3 Crude Death Rate (CDR)

Crude Death Rate (CDR) is the total number of deaths per year per 1,000 population. The Crude Death Rate (CDR) of the State during past 20 years is presented in the chart given below. From the below chart, it is observed that the CDR shows an increasing trend when compared with the year 2001, whereas there is a small decrease compared with the previous year 2019.

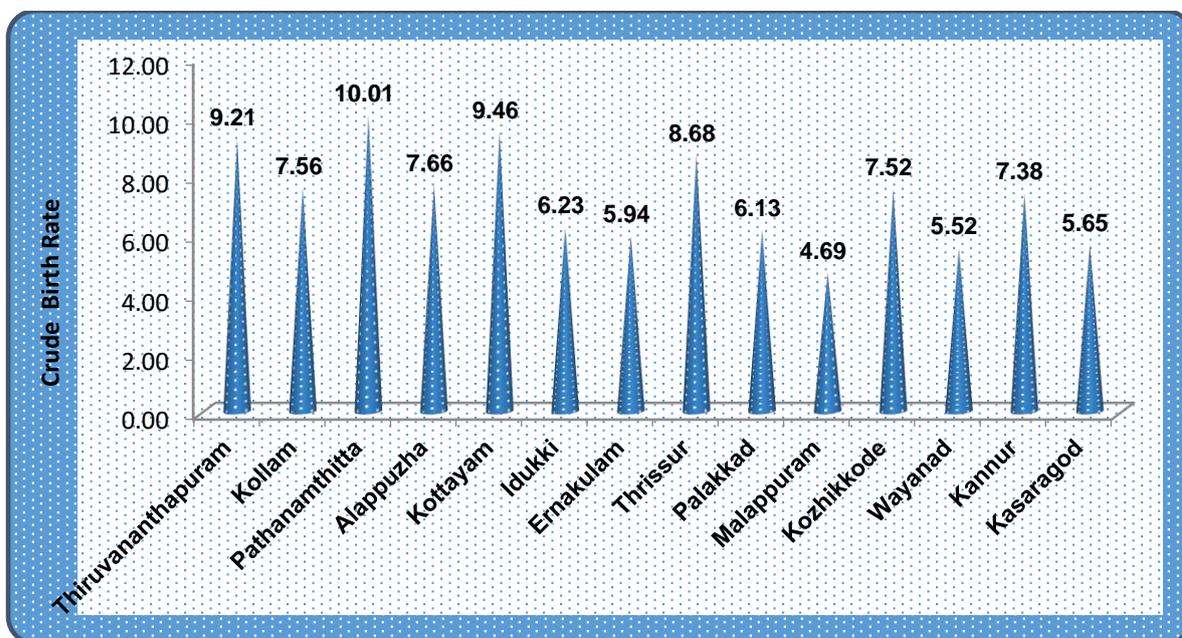

**Chart-6.3-Crude Death Rate (2001-2020)**

### 6.4 District Wise Death Rate

District wise death rates are shown in the chart below. Among the districts the highest death rate 10.01 was recorded in Pathanamthitta followed by Kottayam (9.46) and the lowest in Malappuram (4.69)

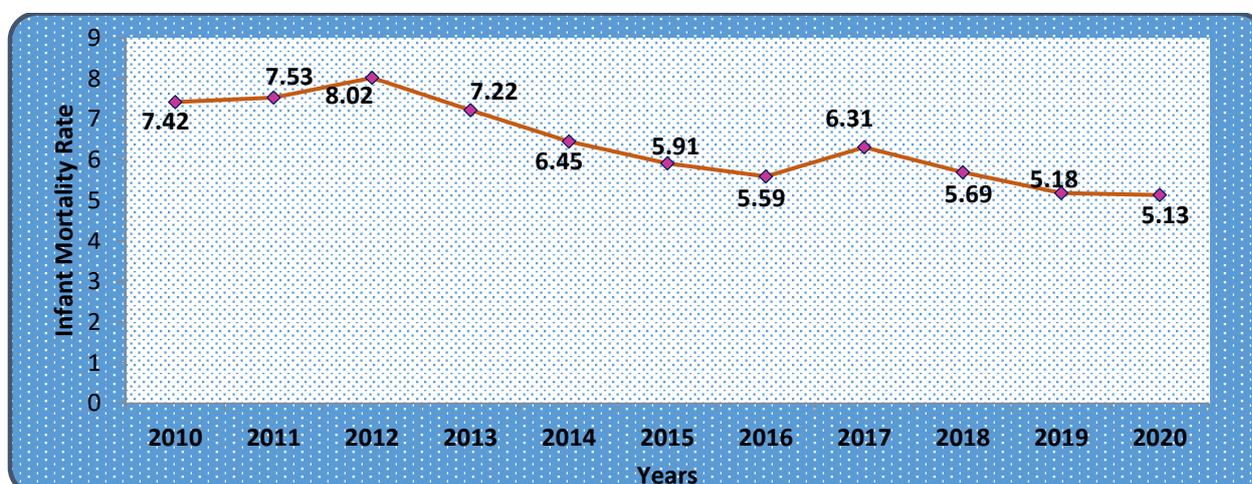

Chart-6.4- District Wise Death Rate 2020

### 6.5 Infant Mortality Rate (IMR)

Infant Mortality Rate is defined as the infant deaths (deaths of a child less than one year old) per thousand live births. Infant mortality rate is a widely used indicator as it provides valuable insights into the health infrastructure and health status of a country. Infant Mortality of the State during 2020 was 5.13 where as it is 5.18 during 2019. IMR of the state during the past 11 years is given in the chart. It is evident from the chart that IMR has decreased from 7.42 in 2010 to 5.13 in 2020.

### 6.5.1 Infant Mortality Rate-District wise

The Table 6.5.1 given below presents the District wise and Sex wise Infant Mortality Rate for the year 2020 .Among the districts, it varies from 1.41 in Kollam to 10.78 in Kozhikode. It is seen that IMR of Male is higher than female in all districts except in Kollam & Palakkad.

**Table – 6.5.1**

### 6.6. Maternal Mortality Ratio (MMR)

As per World Health Organization, “Maternal death is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes”. One of the key indicators of maternal mortality is the Maternal Mortality Ratio (MMR) which is defined as the number of maternal deaths during a given time period per 1,00,000 live births during the same time period. The MMR is used as a measure of the

quality of a health care system. Maternal Mortality Ratio at state level for the year 2020 was computed as 14 where as it was 30 during 2010.

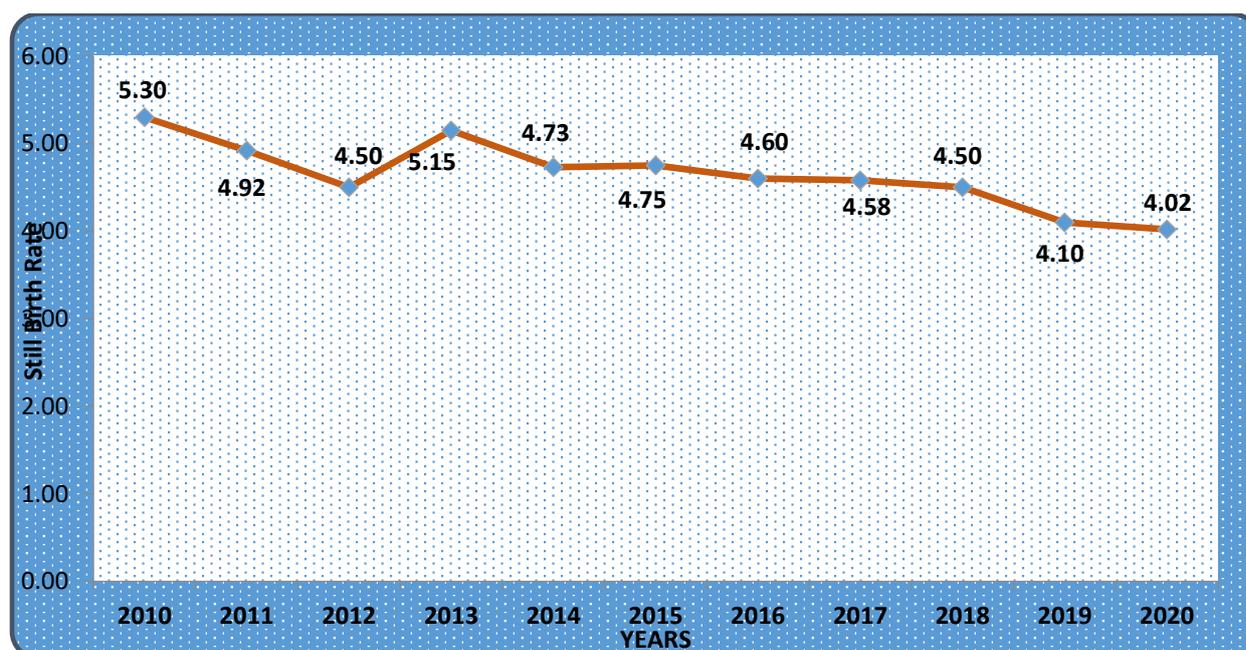

**Chart 6.6. Maternal Mortality Ratio (MMR)-(2010-2020)**

### 6.7 Still Birth Rate (SBR)

The World Health Organization (WHO) defines a still birth as a baby born with no signs of life at or after 28 weeks' gestation. SBR is estimated as the ratio of number of still births per one thousand live births and still births during the year. The SBR came down to 4.02 in 2020 from 4.10 in 2019.

**Chart 6.7 Still Birth Rate (SBR) - (2010-2020)**

## 6.7. Conclusion

*It is worthwhile to mention that CRS is the only source, which can provide vital rates below state level. Even though cent percentage registration has attained in the case of births, under registration of deaths still exist. Level of registration of maternal deaths and infant deaths are comparatively better. There is also need to correctly identify the maternal deaths for estimating the vital indicator MMR. All events of maternal deaths and infant deaths has to be registered to ensure accuracy of rates such as IMR, MMR etc., which are essential for health planning. Hence more care should be given to the proper implementation and monitoring of Civil Registration System.*

## DEFINITIONS USED IN THIS REPORT

1. **Sex ratio** is defined as the number of females per 1000 males in a population

$$\text{Sex Ratio} = \frac{\text{Number of females} \times 1000}{\text{Number of males}}$$

2. **Sex Ratio at birth** =  $\frac{\text{Number of female birth registered during the year} \times 1000}{\text{Number of male birth registered during the year}}$

3. **Masculinity proportion** is the proportion of males in the total population.

$$\text{Masculinity proportion} = \frac{\text{Number of males in the Mid year population}}{\text{Total Mid year population}} \times 1000$$

4. **Aged – Child ratio** indicates whether or not a population is young or ageing

$$\text{Aged child ratio} = \frac{\text{Population of above 60 years}}{\text{Population of below 15 years}} \times 100$$

5. **(Total) Dependency ratio** is an age-population ratio of those typically not in the labour force (the dependent part) and those typically in the labour force (the productive part). It is used to measure the pressure on productive population. The dependent part usually includes those under the age of 15 and over the age of 64. The productive part makes up the population in between, ages 15 – 64. It is normally expressed as a percentage. The **(total) dependency ratio** can be decomposed into the **child dependency ratio** and the **aged dependency ratio**.

$$\text{Total dependency ratio} = \frac{(\text{Population of 0-14 years} + \text{Population of above 65 years})}{\text{Population of 15-64 years}} \times 100$$

$$\text{Young (child) dependency ratio} = \frac{\text{Population of 0-14 years}}{\text{Population of 15-64 years}} \times 100$$

$$\text{Old (aged) dependency ratio} = \frac{\text{Population of above 65 years}}{\text{Population of 15-64 years}} \times 100$$

6. **Crude Birth Rate (CBR)** is the number of live births in a year per thousand of population.

$$\text{Crude Birth Rate} = \frac{\text{Number of Live births during the year}}{\text{Mid-year population}} \times 1000$$

7. **General Fertility Rate (GFR)** is the total number of live births per 1,000 women of childbearing age (ages 15 to 49 years old) in a year.

$$\text{General Fertility Rate} = \frac{\text{Number of live births in a year}}{\text{Mid-year female population in the age group (15-49) years}} \times 1000$$

8. **Age Specific Fertility Rate (ASFR)** is the number of live births per 1,000 women in a particular age groups (usually age 15-19, 20-24 etc.) in a year

$$\text{Age Specific Fertility Rate} = \frac{\text{Number of live birth in a particular age group}}{\text{Mid-year female population of the same age group}} \times 1000$$

9. **Total Fertility Rate (TFR)** may be defined as average number of children that would be born to a woman if she experiences the current fertility pattern throughout her reproductive span (15-49 years).

$$\text{Total fertility rate} = \frac{5 \times \sum_{15-19}^{45-49} \text{ASFR}}{1000}$$

10. **Gross Reproduction Rate (GRR)** is the average number of daughters that would be born to a woman (or a group of women) if she survived at least to the age of 45 and conformed to the age-specific fertility rate of a given year. It is often regarded as the extent to which the generation of daughters replaces the preceding generation of females.

$$\text{Gross reproduction rate} = \frac{5 \times \sum_{15-19}^{45-49} \text{ASFR for female live births}}{1000}$$

**11. Child-woman ratio** is the number of children aged 0 to 4 per 1,000 women of childbearing age. It is used as an index of fertility when reliable birth statistics are not available.

$$\text{Child-women ratio} = \frac{\text{Population of (0-4) age group}}{\text{Female population in the age group of (15-49)}} \times 1000$$

**12. Crude Death Rate (CDR)** is the total number of deaths per year per 1000 people

$$\text{Crude death rate} = \frac{\text{Number of deaths during the year}}{\text{Mid-year population}} \times 1000$$

**13. Infant Mortality Rate (IMR)** is the number of deaths of children less than 1 year old per 1000 live births.

$$\text{Infant mortality rate} = \frac{\text{Number of infant deaths during the year}}{\text{Number of live births during the year}} \times 1000$$

**14. Neo-natal Mortality Rate (NMR)** is the number of deaths during the first 28 completed days of life per 1,000 live births in a given year or period. **Neo-natal deaths** may be subdivided into **early neo-natal deaths**, occurring during the first seven days of life, and **late neo-natal deaths**, occurring after the seventh day but before the 28 completed days of life. **Post neo-natal mortality rate** is the number of deaths after 28 days of life but before one year per 1,000 live births in a given year or period. **Perineo-natal mortality rate** is the number of deaths between the fetal viability (22 weeks gestation) and the end of the 7th day after delivery per 1,000 live births in a given year or period.
